The babel package is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel in real documents only as documented (except, of course, if you want to explore and test them).

## 1. Identification and loading of required files

The babel package after unpacking consists of the following files:

**babel.sty** is the  $\LaTeX$  package, which set options and load language styles.

**babel.def** is loaded by Plain.

**switch.def** defines macros to set and switch languages (it loads part babel.def).

**plain.def** is not used, and just loads babel.def, for compatibility.

**hyphen.cfg** is the file to be used when generating the formats to load hyphenation patterns.

There some additional tex, def and lua files.

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with `<@name@>` at the appropriate places in the source code and defined with either `<<name=value>>`, or with a series of lines between `<<*name>>` and `<</name>>`. The latter is cumulative (e.g., with *More package options*). That brings a little bit of literate programming. The guards `<-name>` and `<+name>` have been redefined, too. See babel.ins for further details.

## 2. locale directory

A required component of babel is a set of ini files with basic definitions for about 300 languages. They are distributed as a separate zip file, not packed as dtx. Many of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (e.g., there are no geographic areas in Spanish). Not all include LICR variants.

babel-\*.ini files contain the actual data; babel-\*.tex files are basically proxies to the corresponding ini files.

See [Keys in ini files](#) in the the babel site.

## 3. Tools

```
1 <<version=25.13.101634>>
2 <<date=2025/10/12>>
```

**Do not use the following macros in ldf files. They may change in the future.** This applies mainly to those recently added for replacing, trimming and looping. The older ones, like `\bbl@afterfi`, will not change. We define some basic macros which just make the code cleaner. `\bbl@add` is now used internally instead of `\addto` because of the unpredictable behavior of the latter. Used in babel.def and in babel.sty, which means in  $\LaTeX$  is executed twice, but we need them when defining options and babel.def cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```
3 <<*Basic macros>> ≡
4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8   {\def#1{#2}}%
9   {\expandafter\def\expandafter#1\expandafter{#1#2}}}
10 \def\bbl@xin@{\@expandtwoargs\in@}
11 \def\bbl@carg#1#2{\expandafter#1\csname#2\endcsname}%
12 \def\bbl@ncarg#1#2#3{\expandafter#1\expandafter#2\csname#3\endcsname}%
13 \def\bbl@ccarg#1#2#3{%
14   \expandafter#1\csname#2\expandafter\endcsname\csname#3\endcsname}%
15 \def\bbl@carg#1#2{\expandafter#1\csname bbl@#2\endcsname}%
16 \def\bbl@cs#1{\csname bbl@#1\endcsname}
17 \def\bbl@c#1{\csname bbl@#1\language\endcsname}
18 \def\bbl@loop#1#2#3{\bbl@loop#1{#3}#2,\@nnil,}
19 \def\bbl@loopx#1#2{\expandafter\bbl@loop\expandafter#1\expandafter{#2}}
```

```

20 \def\bbl@loop#1#2#3,{%
21   \ifx\@nnil#3\relax\else
22     \def#1{#3}#2\bbl@afterfi\bbl@loop#1{#2}%
23   \fi}
24 \def\bbl@for#1#2#3{\bbl@loopx#1{#2}{\ifx#1\@empty\else#3\fi}}

```

**\bbl@add@list** This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```

25 \def\bbl@add@list#1#2{%
26   \edef#1{%
27     \bbl@ifunset{\bbl@stripslash#1}%
28     }%
29     {\ifx#1\@empty\else#1,\fi}%
30   #2}}

```

### **\bbl@afterelse**

**\bbl@afterfi** Because the code that is used in the handling of active characters may need to look ahead, we take extra care to ‘throw’ it over the \else and \fi parts of an \if-statement<sup>1</sup>. These macros will break if another \if... \fi statement appears in one of the arguments and it is not enclosed in braces.

```

31 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
32 \long\def\bbl@afterfi#1\fi{\fi#1}

```

**\bbl@exp** Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here \ stands for \noexpand, \< for \noexpand applied to a built macro name (which does not define the macro if undefined to \relax, because it is created locally), and \[ . . ] for one-level expansion (where . . is the macro name without the backslash). The result may be followed by extra arguments, if necessary.

```

33 \def\bbl@exp#1{%
34   \begingroup
35   \let\<\noexpand
36   \let\<\bbl@exp@en
37   \let\[\bbl@exp@ue
38   \edef\bbl@exp@aux{\endgroup#1}%
39   \bbl@exp@aux}
40 \def\bbl@exp@en#1>{\expandafter\noexpand\csname#1\endcsname}%
41 \def\bbl@exp@ue#1]{%
42   \unexpanded\expandafter\expandafter\expandafter{\csname#1\endcsname}}%

```

**\bbl@trim** The following piece of code is stolen (with some changes) from keyval, by David Carlisle. It defines two macros: \bbl@trim and \bbl@trim@def. The first one strips the leading and trailing spaces from the second argument and then applies the first argument (a macro, \toks@ and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```

43 \def\bbl@tempa#1{%
44   \long\def\bbl@trim##1##2{%
45     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
46   \def\bbl@trim@c{%
47     \ifx\bbl@trim@a\sptoken
48       \expandafter\bbl@trim@b
49     \else
50       \expandafter\bbl@trim@b\expandafter#1%
51     \fi}%
52   \long\def\bbl@trim@b#1##1 \@nil{\bbl@trim@i##1}}
53 \bbl@tempa{ }
54 \long\def\bbl@trim@i#1\@nil#2\relax#3{#3{#1}}
55 \long\def\bbl@trim@def#1{\bbl@trim{\def#1}}

```

<sup>1</sup>This code is based on code presented in TUGboat vol. 12, no2, June 1991 in “An expansion Power Lemma” by Sonja Maus.

**\bbl@ifunset** To check if a macro is defined, we create a new macro, which does the same as `\ifundefined`. However, in an  $\epsilon$ -tex engine, it is based on `\ifcsname`, which is more efficient, and does not waste memory. Defined inside a group, to avoid `\ifcsname` being implicitly set to `\relax` by the `\csname` test.

```

56 \begingroup
57 \gdef\bbl@ifunset#1{%
58   \expandafter\ifx\csname#1\endcsname\relax
59     \expandafter\@firstoftwo
60   \else
61     \expandafter\@secondoftwo
62   \fi}
63 \bbl@ifunset{ifcsname}%
64 {}%
65 {\gdef\bbl@ifunset#1{%
66   \ifcsname#1\endcsname
67     \expandafter\ifx\csname#1\endcsname\relax
68       \bbl@afterelse\expandafter\@firstoftwo
69     \else
70       \bbl@afterfi\expandafter\@secondoftwo
71     \fi
72   \else
73     \expandafter\@firstoftwo
74   \fi}}
75 \endgroup

```

**\bbl@ifblank** A tool from url, by Donald Arseneau, which tests if a string is empty or space. The companion macros tests if a macro is defined with some ‘real’ value, i.e., not `\relax` and not empty,

```

76 \def\bbl@ifblank#1{%
77   \bbl@ifblank@i#1\@nil\@nil\@secondoftwo\@firstoftwo\@nil}
78 \long\def\bbl@ifblank@i#1#2\@nil#3#4#5\@nil#4#5%
79 \def\bbl@ifset#1#2#3{%
80   \bbl@ifunset{#1}{#3}{\bbl@exp{\bbl@ifblank{\@nameuse{#1}}}{#3}{#2}}}

```

For each element in the comma separated `<key>=<value>` list, execute `<code>` with #1 and #2 as the key and the value of current item (trimmed). In addition, the item is passed verbatim as #3. With the `<key>` alone, it passes `\@empty` as value (i.e., the macro thus named, not an empty argument, which is what you get with `<key>=` and no value).

```

81 \def\bbl@forkv#1#2{%
82   \def\bbl@kvcmd##1##2##3{#2}%
83   \bbl@kvnext#1,\@nil,}
84 \def\bbl@kvnext#1,{%
85   \ifx\@nil#1\relax\else
86     \bbl@ifblank{#1}{\bbl@forkv@eq#1=\@empty=\@nil{#1}}%
87     \expandafter\bbl@kvnext
88   \fi}
89 \def\bbl@forkv@eq#1=#2=#3\@nil#4{%
90   \bbl@trim\def\bbl@forkv@a{#1}%
91   \bbl@trim{\expandafter\bbl@kvcmd\expandafter{\bbl@forkv@a}}{#2}{#4}}

```

A *for* loop. Each item (trimmed) is #1. It cannot be nested (it’s doable, but we don’t need it).

```

92 \def\bbl@vforeach#1#2{%
93   \def\bbl@forcmd##1{#2}%
94   \bbl@fornext#1,\@nil,}
95 \def\bbl@fornext#1,{%
96   \ifx\@nil#1\relax\else
97     \bbl@ifblank{#1}{\bbl@trim\bbl@forcmd{#1}}%
98     \expandafter\bbl@fornext
99   \fi}
100 \def\bbl@foreach#1{\expandafter\bbl@vforeach\expandafter{#1}}

```

Some code should be executed once. The first argument is a flag.

```

101 \global\let\bbl@done\@empty

```

```

102 \def\bbl@once#1#2{%
103   \bbl@xin@{,#1,}{,\bbl@done,}%
104   \ifin@ \else
105     #2%
106   \xdef\bbl@done{\bbl@done,#1,}%
107   \fi}
108 %   \end{macrodef}
109 %
110 % \macro{\bbl@replace}
111 %
112 % Returns implicitly |\toks@| with the modified string.
113 %
114 %   \begin{macrocode}
115 \def\bbl@replace#1#2#3{% in #1 -> repl #2 by #3
116   \toks@{ }%
117   \def\bbl@replace@aux##1#2##2#2{%
118     \ifx\bbl@nil##2%
119       \toks@ \expandafter{\the\toks@##1}%
120     \else
121       \toks@ \expandafter{\the\toks@##1#3}%
122       \bbl@afterfi
123       \bbl@replace@aux##2#2%
124     \fi}%
125   \expandafter\bbl@replace@aux#1#2\bbl@nil#2%
126   \edef#1{\the\toks@}}

```

An extension to the previous macro. It takes into account the parameters, and it is string based (i.e., if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure checking the replacement is really necessary or just paranoia).

```

127 \ifx\detokenize\undefined \else % Unused macros if old Plain TeX
128   \bbl@exp{\def\\bbl@parsedef##1\detokenize{macro:}}#2->#3\relax{%
129     \def\bbl@tempa{#1}%
130     \def\bbl@tempb{#2}%
131     \def\bbl@tempe{#3}}
132   \def\bbl@sreplace#1#2#3{%
133     \begingroup
134       \expandafter\bbl@parsedef\meaning#1\relax
135       \def\bbl@tempc{#2}%
136       \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
137       \def\bbl@tempd{#3}%
138       \edef\bbl@tempd{\expandafter\strip@prefix\meaning\bbl@tempd}%
139       \bbl@xin@{\bbl@tempc}{\bbl@tempe}% If not in macro, do nothing
140       \ifin@
141         \bbl@exp{\\bbl@replace\\bbl@tempe{\bbl@tempc}{\bbl@tempd}}%
142         \def\bbl@tempc{% Expanded an executed below as 'uplevel'

145             \bbl@tempa\\@namedef{\bbl@stripslash#1}\bbl@tempb{\bbl@tempe}%
146             \noexpand\noexpand}%
147           \catcode64=\the\catcode64\relax}% Restore @
148       \else
149         \let\bbl@tempc\empty % Not \relax
150       \fi
151       \bbl@exp{% For the 'uplevel' assignments
152     \endgroup
153     \bbl@tempc}} % empty or expand to set #1 with changes
154 \fi

```

Two further tools. \bbl@ifsamestring first expand its arguments and then compare their expansion (sanitized, so that the catcodes do not matter). \bbl@engine takes the following values: 0 is pdf<sub>La</sub>T<sub>E</sub>X, 1 is luatex, and 2 is xetex. You may use the latter it in your language style if you want.

```

155 \def\bbl@ifsamestring#1#2{%
156   \begingroup
157   \protected@edef\bbl@tempb{#1}%
158   \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
159   \protected@edef\bbl@tempc{#2}%
160   \edef\bbl@tempc{\expandafter\strip@prefix\meaning\bbl@tempc}%
161   \ifx\bbl@tempb\bbl@tempc
162     \aftergroup\@firstoftwo
163   \else
164     \aftergroup\@secondoftwo
165   \fi
166 \endgroup}
167 \chardef\bbl@engine=%
168 \ifx\directlua\@undefined
169   \ifx\XeTeXinputencoding\@undefined
170     \z@
171   \else
172     \tw@
173   \fi
174 \else
175   \@ne
176 \fi

```

A somewhat hackish tool (hence its name) to avoid spurious spaces in some contexts.

```

177 \def\bbl@bsphack{%
178   \ifhmode
179     \hskip\z@skip
180     \def\bbl@esphack{\loop\ifdim\lastskip>\z@\unskip\repeat\unskip}%
181   \else
182     \let\bbl@esphack\@empty
183   \fi}

```

Another hackish tool, to apply case changes inside a protected macros. It's based on the internal `\let's` made by `\MakeUppercase` and `\MakeLowercase` between things like `\oe` and `\OE`.

```

184 \def\bbl@cased{%
185   \ifx\oe\OE
186     \expandafter\in@\expandafter
187     {\expandafter\OE\expandafter}\expandafter{\oe}%
188   \ifin@
189     \bbl@afterelse\expandafter\MakeUppercase
190   \else
191     \bbl@afterfi\expandafter\MakeLowercase
192   \fi
193 \else
194   \expandafter\@firstofone
195 \fi}

```

The following adds some code to `\extras...` both before and after, while avoiding doing it twice. It's somewhat convoluted, to deal with `#`'s. Used to deal with `alph`, `Alph` and frenchspacing when there are already changes (with `\babel@save`).

```

196 \def\bbl@extras@wrap#1#2#3{% 1:in-test, 2:before, 3:after
197   \toks@\expandafter\expandafter\expandafter{%
198     \csname extras\language\endcsname}%
199   \bbl@exp{\in{#1}{\the\toks@}}%
200   \ifin@\else
201     \@temptokena{#2}%
202     \edef\bbl@tempc{\the\@temptokena\the\toks@}%
203     \toks@\expandafter{\bbl@tempc#3}%
204     \expandafter\edef\csname extras\language\endcsname{\the\toks@}%
205   \fi}
206 <</Basic macros>>

```

Some files identify themselves with a  $\TeX$  macro. The following code is placed before them to define (and then undefine) if not in  $\TeX$ .

```

207 <<*Make sure ProvidesFile is defined> ≡
208 \ifx\ProvidesFile\undefined
209 \def\ProvidesFile#1[#2 #3 #4]{%
210 \wlog{File: #1 #4 #3 <#2>}%
211 \let\ProvidesFile\undefined}
212 \fi
213 <</Make sure ProvidesFile is defined>

```

### 3.1. A few core definitions

**\language** Just for compatibility, for not to touch hyphen.cfg.

```

214 <<*Define core switching macros> ≡
215 \ifx\language\undefined
216 \csname newcount\endcsname\language
217 \fi
218 <</Define core switching macros>

```

**\last@language** Another counter is used to keep track of the allocated languages.  $\TeX$  and  $\LaTeX$  reserves for this purpose the count 19.

**\addlanguage** This macro was introduced for  $\TeX < 2$ . Preserved for compatibility.

```

219 <<*Define core switching macros> ≡
220 \countdef\last@language=19
221 \def\addlanguage{\csname newlanguage\endcsname}
222 <</Define core switching macros>

```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it).

Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

### 3.2. $\LaTeX$ : babel.sty (start)

Here starts the style file for  $\LaTeX$ . It also takes care of a number of compatibility issues with other packages.

```

223 <*package>
224 \NeedsTeXFormat{LaTeX2e}
225 \ProvidesPackage{babel}%

291   \fi%

```

### 3.3. base

The first 'real' option to be processed is base, which set the hyphenation patterns then resets `ver@babel.sty` so that  $\TeX$  forgets about the first loading. After a subset of `babel.def` has been loaded (the old `switch.def`) and `\AfterBabelLanguage` defined, it exits.

Now the base option. With it we can define (and load, with luatex) hyphenation patterns, even if we are not interested in the rest of babel.

```

292 \bbl@trace{Defining option 'base'}
293 \@ifpackagewith{babel}{base}{%
294   \let\bbl@onlyswitch\@empty

311   \endinput}{}%

```

### 3.4. key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`.

```

312 \bbl@trace{key=value and another general options}
313 \bbl@csarg\let\tempa\expandafter\csname opt@babel.sty\endcsname
314 \def\bbl@tempb#1.#2{% Removes trailing dot
315   #1\ifx\@empty#2\else,\bbl@afterfi\bbl@tempb#2\fi}%
316 \def\bbl@tempe#1=#2\@@{%
317   \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}}
318 \def\bbl@tempd#1.#2\@nnil{%
319   \ifx\@empty#2%
320     \edef\bbl@tempc{\ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1}%
321   \else
322     \in@{,provide=}{, #1}%
323     \ifin@
324       \edef\bbl@tempc{%
325         \ifx\bbl@tempc\@empty\else\bbl@tempc,\fi#1.\bbl@tempb#2}%
326     \else
327       \in@{ $modifiers$ }{ $ #1 $}%
328       \ifin@

336           \bbl@csarg\edef{mod@#1}{\bbl@tempb#2}%
337         \fi
338       \fi
339     \fi
340   \fi}
341 \let\bbl@tempc\@empty
342 \bbl@foreach\bbl@tempa{\bbl@tempd#1.\@empty\@nnil}
343 \expandafter\let\csname opt@babel.sty\endcsname\bbl@tempc

```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want

to use the shorthand characters in the preamble of their documents this can help.

```

344 \DeclareOption{KeepShorthandsActive}{}
345 \DeclareOption{activeacute}{}
346 \DeclareOption{activegrave}{}
347 \DeclareOption{debug}{}
348 \DeclareOption{noconfigs}{}
349 \DeclareOption{showlanguages}{}
350 \DeclareOption{silent}{}
351 \DeclareOption{shorthands=off}{\bbl@tempa shorthands=\bbl@tempa}
352 \chardef\bbl@iniflag\z@
353 \DeclareOption{provide=*}{\chardef\bbl@iniflag\@ne} % main = 1
354 \DeclareOption{provide+=*}{\chardef\bbl@iniflag\tw@} % second = 2
355 \DeclareOption{provide*=*}{\chardef\bbl@iniflag\thr@@} % second + main
356 \chardef\bbl@ldfflag\z@
357 \DeclareOption{provide=!}{\chardef\bbl@ldfflag\@ne} % main = 1
358 \DeclareOption{provide+=!}{\chardef\bbl@ldfflag\tw@} % second = 2
359 \DeclareOption{provide*=!}{\chardef\bbl@ldfflag\thr@@} % second + main
360 % Don't use. Experimental.
361 \newif\ifbbl@single
362 \DeclareOption{selectors=off}{\bbl@singletrue}
363 <@More package options>

```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea, anyway.) The first one processes options which has been declared above or follow the syntax  $\langle key \rangle = \langle value \rangle$ , the second one loads the requested languages, except the main one if set with the key main, and the third one loads the latter. First, we “flag” valid keys with a nil value.

```

364 \let\bbl@opt@shorthands\@nnil
365 \let\bbl@opt@config\@nnil
366 \let\bbl@opt@main\@nnil
367 \let\bbl@opt@headfoot\@nnil
368 \let\bbl@opt@layout\@nnil
369 \let\bbl@opt@provide\@nnil

```

The following tool is defined temporarily to store the values of options.

```

370 \def\bbl@tempa#1=#2\bbl@tempa{%
371   \bbl@csarg\ifx{opt@#1}\@nnil
372   \bbl@csarg\edef{opt@#1}{#2}%
373   \else
374   \bbl@error{bad-package-option}{#1}{#2}{}%
375   \fi}

```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and  $\langle key \rangle = \langle value \rangle$  options (the former take precedence). Unrecognized options are saved in `\bbl@language@opts`, because they are language options.

```

376 \let\bbl@language@opts\@empty
377 \DeclareOption*{%
378   \bbl@xin@{\string=}{\CurrentOption}%
379   \ifin@
380     \expandafter\bbl@tempa\CurrentOption\bbl@tempa
381   \else
382     \bbl@add@list\bbl@language@opts{\CurrentOption}%
383   \fi}

```

Now we finish the first pass (and start over).

```

384 \ProcessOptions*

```

### 3.5. Post-process some options

```

385 \ifx\bbl@opt@provide\@nnil
386   \let\bbl@opt@provide\@empty % %%% MOVE above
387 \else
388   \chardef\bbl@iniflag\@ne
389   \bbl@exp{\bbl@forkv{\@nameuse{@raw@opt@babel.sty}}}{%

```

```

390 \in@{,provide,}{, #1,}%
391 \ifin@
392 \def\bbl@opt@provide{#2}%
393 \fi}
394 \fi

```

If there is no `shorthands=<chars>`, the original babel macros are left untouched, but if there is, these macros are wrapped (in `babel.def`) to define only those given.

A bit of optimization: if there is no `shorthands=`, then `\bbl@ifshorthand` is always true, and it is always false if `shorthands` is empty. Also, some code makes sense only with `shorthands=...`

```

395 \bbl@trace{Conditional loading of shorthands}
396 \def\bbl@sh@string#1{%
397 \ifx#1\@empty\else
398 \ifx#1t\string~%
399 \else\ifx#1c\string,%
400 \else\string#1%
401 \fi\fi
402 \expandafter\bbl@sh@string
403 \fi}
404 \ifx\bbl@opt@shorthands\@nnil
405 \def\bbl@ifshorthand#1#2#3{#2}%
406 \else\ifx\bbl@opt@shorthands\@empty
407 \def\bbl@ifshorthand#1#2#3{#3}%
408 \else

```

The following macro tests if a shorthand is one of the allowed ones.

```

409 \def\bbl@ifshorthand#1{%
410 \bbl@xin@{\string#1}{\bbl@opt@shorthands}%
411 \ifin@
412 \expandafter\@firstoftwo
413 \else
414 \expandafter\@secondoftwo
415 \fi}

```

We make sure all chars in the string are ‘other’, with the help of an auxiliary macro defined above (which also zaps spaces).

```

416 \edef\bbl@opt@shorthands{%
417 \expandafter\bbl@sh@string\bbl@opt@shorthands\@empty}%

```

The following is ignored with `shorthands=off`, since it is intended to take some additional actions for certain chars.

```

418 \bbl@ifshorthand{'}%
419 {\PassOptionsToPackage{activeacute}{babel}}{}
420 \bbl@ifshorthand{`}%
421 {\PassOptionsToPackage{activegrave}{babel}}{}
422 \fi\fi

```

With `headfoot=lang` we can set the language used in heads/feet. For example, in `babel/3796` just add `headfoot=english`. It misuses `\@resetactivechars`, but seems to work.

```

423 \ifx\bbl@opt@headfoot\@nnil\else
424 \g@addto@macro\@resetactivechars{%
425 \set@typeset@protect
426 \expandafter\select@language@x\expandafter{\bbl@opt@headfoot}%
427 \let\protect\noexpand}
428 \fi

```

For the option `safe` we use a different approach – `\bbl@opt@safe` says which macros are redefined (B for bibs and R for refs). By default, both are currently set, but in a future release it will be set to none.

```

429 \ifx\bbl@opt@safe\@undefined
430 \def\bbl@opt@safe{BR}
431 % \let\bbl@opt@safe\@empty % Pending of \cite
432 \fi

```

For layout an auxiliary macro is provided, available for packages and language styles.

Optimization: if there is no layout, just do nothing.

```

433 \bbl@trace{Defining IfBabelLayout}

```

```

434 \ifx\bbl@opt@layout\@nnil
435 \newcommand\IfBabelLayout[3]{#3}%
436 \else
437 \bbl@exp{\bbl@forkv{\@nameuse{@raw@opt@babel.sty}}}{%
438 \in@{,layout,}{, #1,}%
439 \ifin@
440 \def\bbl@opt@layout{#2}%
441 \bbl@replace\bbl@opt@layout{ }{.}%
442 \fi}
443 \newcommand\IfBabelLayout[1]{%
444 \@expandtwoargs\in@{.#1.}{.\bbl@opt@layout.}%
445 \ifin@
446 \expandafter\@firstoftwo
447 \else
448 \expandafter\@secondoftwo
449 \fi}
450 \fi
451 \end{package}

```

### 3.6. Plain: babel.def (start)

Because of the way docstrip works, we need to insert some code for Plain here. However, the tools provided by the babel installer for literate programming makes this section a short interlude, because the actual code is below, tagged as *Emulate LaTeX*.

First, exit immediately if previously loaded.

```

452 \ifx\ldf@quit\undefined\else
453 \endinput\fi % Same line!
454 \endinput\fi % Make sure ProvidesFile is defined
455 \ProvidesFile{babel.def}[<@date> v<@version> Babel common definitions]
456 \ifx\AtBeginDocument\undefined
457 \endinput\fi
458 \endinput\fi
459 \fi
460 \endinput\fi
461 \endinput\fi

```

That is all for the moment. Now follows some common stuff, for both Plain and  $\text{\LaTeX}$ . After it, we will resume the  $\text{\LaTeX}$ -only stuff.

## 4. babel.sty and babel.def (common)

```

462 \ifx\ldf@quit\undefined\else
463 \endinput\fi % Same line!
464 \endinput\fi % Make sure ProvidesFile is defined
465 \endinput\fi

```

**\adddialect** The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```

466 \def\adddialect#1#2{%
467 \global\chardef#1#2\relax
468 \bbl@usehooks{adddialect}{#1}{#2}%
469 \begingroup
470 \count@#1\relax
471 \def\bbl@elt##1##2##3##4{%
472 \ifnum\count@=#1\relax
473 \edef\bbl@tempa{\expandafter\@gobbletwo\string#1}%

475 set to \expandafter\string\csname l@##1\endcsname\%
476 (\string\language\the\count@). Reported}%
477 \def\bbl@elt###1###2###3###4{%
478 \fi}%
479 \bbl@cs{languages}%
480 \endgroup}

```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error.

The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (lc/uc) is wrong. It’s an attempt to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named MYLANG, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```

481 \def\bbl@fixname#1{%
482   \begingroup
483   \def\bbl@tempe{l}%

496   \bbl@exp{\bbl@usehooks{language}{\language}{#1}}%
497 \def\bbl@iflanguage#1{%
498   \@ifundefined{l@#1}{\@nolanerr{#1}\@gobble}\@firstofone}

```

After a name has been ‘fixed’, the selectors will try to load the language. If even the fixed name is not defined, will load it on the fly, either based on its name, or if activated, its BCP 47 code.

We first need a couple of macros for a simple BCP 47 look up. It also makes sure, with `\bbl@bcpcase`, casing is the correct one, so that `sr-latn-ba` becomes `fr-Latn-BA`. Note #4 may contain some `\@empty`’s, but they are eventually removed.

`\bbl@bcpllookup` either returns the found ini tag or it is `\relax`.

```

499 \def\bbl@bcpcase#1#2#3#4\@#5{%
500   \ifx\@empty#3%
501     \uppercase{\def#5{#1#2}}%

537     \fi
538 \fi\fi}
539 \let\bbl@initoload\relax

```

**\iflanguage** Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```

540 \def\iflanguage#1{%
541     \bbl@iflanguage{#1}{%
542         \ifnum\csname l@#1\endcsname=\language
543             \expandafter\@firstoftwo
544         \else
545             \expandafter\@secondoftwo
546         \fi}}

```

## 4.1. Selecting the language

**\selectlanguage** It checks whether the language is already defined before it performs its actual task, which is to update `\language` and activate language-specific definitions.

```

547 \let\bbl@select@type\z@
548 \edef\selectlanguage{%
549     \noexpand\protect
550     \expandafter\noexpand\csname selectlanguage \endcsname}

```

Because the command `\selectlanguage` could be used in a moving argument it expands to `\protect\selectlanguage`. Therefore, we have to make sure that a macro `\protect` exists. If it doesn't it is `\let to \relax`.

```

551 \ifx\@undefined\protect\let\protect\relax\fi

```

The following definition is preserved for backwards compatibility (e.g., *arabi*, *koma*). It is related to a trick for 2.09, now discarded.

```

552 \let\xstring\string

```

Since version 3.5 *babel* writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

**\bbl@pop@language** But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need  $\TeX$ 's `aftergroup` mechanism to help us. The command `\aftergroup` stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence `\bbl@pop@language` to be executed at the end of the group. It calls `\bbl@set@language` with the name of the current language as its argument.

**\bbl@language@stack** The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called `\bbl@language@stack` and initially empty.

```

553 \def\bbl@language@stack{}

```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

**\bbl@push@language**

**\bbl@pop@language** The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

```

554 \def\bbl@push@language{%
555   \ifx\language\undefined\else
556     \ifx\currentgrouplevel\undefined

563       \fi
564     \fi
565 \fi}

```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro \language. For this we first define a helper function.

**\bbl@pop@lang** This macro stores its first element (which is delimited by the '+'-sign) in \language and stores the rest of the string in \bbl@language@stack.

```

566 \def\bbl@pop@lang#1+#2\@@{%
567   \edef\language{#1}%
568   \xdef\bbl@language@stack{#2}}

```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before \bbl@pop@lang is executed TeX first *expands* the stack, stored in \bbl@language@stack. The result of that is that the argument string of \bbl@pop@lang contains one or more language names, each followed by a '+'-sign (zero language names won't occur as this macro will only be called after something has been pushed on the stack).

```

569 \let\bbl@ifrestoring\@secondoftwo
570 \def\bbl@pop@language{%
571   \expandafter\bbl@pop@lang\bbl@language@stack\@@
572   \let\bbl@ifrestoring\@firstoftwo
573   \expandafter\bbl@set@language\expandafter{\language}%
574   \let\bbl@ifrestoring\@secondoftwo}

```

Once the name of the previous language is retrieved from the stack, it is fed to \bbl@set@language to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of \localeid. This means \l@... will be reserved for hyphenation patterns (so that two locales can share the same rules).

```

575 \chardef\localeid\z@
576 \gdef\bbl@id@last{0} % No real need for a new counter

597 \let\endselectlanguage\relax

```

**\bbl@set@language** The macro \bbl@set@language takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either language of \language. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in \language are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining \BabelContentsFiles, but make sure they are loaded inside a group (as aux, toc, lof, and lot do) or the last language of the document will remain active afterwards.

We also write a command to change the current language in the auxiliary files.

\bbl@savelastskip is used to deal with skips before the write whatsit (as suggested by U Fischer). Adapted from hyperref, but it might fail, so I'll consider it a temporary hack, while I study other options (the ideal, but very likely unfeasible except perhaps in luatex, is to avoid the \write altogether when not needed).

```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring `TEX` in a certain pre-defined state.

The name of the language is stored in the control sequence `\language`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras<language>` command at definition time by expanding the `\csname` primitive.

Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\<language>hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\<language>hyphenmins` will be used.

No text is supposed to be added with switching captions and date, so we remove any spurious spaces with `\bbl@bsphack` and `\bbl@esphack`.

```

750 \expandafter\let\csname endotherlanguage*\endcsname\relax

```

**\foreignlanguage** This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument.

Unlike `\selectlanguage` this command doesn’t switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras<language>` command doesn’t make any global changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a ‘text’ command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

`(3.11) \foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in vmode and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into hmode with the surrounding lang, and with `\foreignlanguage*` with the new lang.

**\set@hyphenmins** This macro sets the values of `\lefthyphenmin` and `\righthyphenmin`. It expects two values as its argument.

```

849 \def\set@hyphenmins#1#2{%
850   \lefthyphenmin#1\relax
851   \righthyphenmin#2\relax}

```

**\ProvidesLanguage** The identification code for each file is something that was introduced in  $\text{\LaTeX 2}_\epsilon$ . When the command `\ProvidesFile` does not exist, a dummy definition is provided temporarily. For use in the language definition file the command `\ProvidesLanguage` is defined by `babel`.

Depending on the format, i.e., or if the former is defined, we use a similar definition or not.

```

852 \ifx\ProvidesFile\@undefined
853   \def\ProvidesLanguage#1[#2 #3 #4]{%
854     \wlog{Language: #1 #4 #3 <#2>}%
855   }
856 \else
857   \def\ProvidesLanguage#1{%
858     \begingroup
859     \catcode`\ 10 %
860     \@makeother\%
861     \@ifnextchar[%]
862       {\@provideslanguage{#1}}{\@provideslanguage{#1}[]}
863   \def\@provideslanguage#1[#2]{%
864     \wlog{Language: #1 #2}%
865     \expandafter\xdef\csname ver@#1.ldf\endcsname{#2}%
866   \endgroup}
867 \fi

```

**\originalTeX** The macro `\originalTeX` should be known to  $\text{\TeX}$  at this moment. As it has to be expandable we `\let` it to `\@empty` instead of `\relax`.

```

868 \ifx\originalTeX\@undefined\let\originalTeX\@empty\fi

```

Because this part of the code can be included in a format, we make sure that the macro which initializes the save mechanism, `\babel@beginsave`, is not considered to be undefined.

```

869 \ifx\babel@beginsave\@undefined\let\babel@beginsave\relax\fi

```

A few macro names are reserved for future releases of babel, which will use the concept of ‘locale’:

```
870 \providecommand\setlocale{\bbl@error{not-yet-available}}{}{}}
871 \let\uselocale\setlocale
872 \let\locale\setlocale
873 \let\selectlocale\setlocale
874 \let\textlocale\setlocale
875 \let\textlanguage\setlocale
876 \let\languagegetext\setlocale
```

## 4.2. Errors

### **\@nolanerr**

**\@nopatterns** The babel package will signal an error when a documents tries to select a language that hasn’t been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for \language=0 in that case. In most formats that will be (US)english, but it might also be empty.

**\@noopterr** When the package was loaded without options not everything will work as expected. An error message is issued in that case.

When the format knows about \PackageError it must be L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>, so we can safely use its error handling interface. Otherwise we’ll have to ‘keep it simple’.

Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

## 4.3. More on selection

**\babelensure** The user command just parses the optional argument and creates a new macro named \bbl@e@<language>. We register a hook at the afterextras event which just executes this macro in a

“complete” selection (which, if undefined, is `\relax` and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times.

The macro `\bbl@e@<language>` contains `\bbl@ensure{<include>}{<exclude>}{<fontenc>}`, which in turn loops over the macros names in `\bbl@captionslist`, excluding (with the help of `\in@`) those in the exclude list. If the fontenc is given (and not `\relax`), the `\fontencoding` is also added. Then we loop over the include list, but if the macro already contains `\foreignlanguage`, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

908 \bbl@trace{Defining babelensure}
909 \newcommand\babelensure[2][{}]{%
910   \AddBabelHook{babel-ensure}{afterextras}{%

971   \alsoname\proofname\glossaryname}

```

#### 4.4. Short tags

**\babeltags** This macro is straightforward. After zapping spaces, we loop over the list and define the macros `\text<tag>` and `\<tag>`. Definitions are first expanded so that they don't contain `\csname` but the actual macro.

```

972 \bbl@trace{Short tags}
973 \newcommand\babeltags[1]{%
974   \edef\bbl@tempa{\zap@space#1 \@empty}%
975   \def\bbl@tempb##1=##2\@{%
976     \edef\bbl@tempc{%

980         \expandafter\noexpand\csname otherlanguage*\endcsname{##2}}
981       \noexpand\newcommand
982       \expandafter\noexpand\csname text##1\endcsname{%
983         \noexpand\foreignlanguage{##2}}
984     \bbl@tempc}%
985   \bbl@for\bbl@tempa\bbl@tempa{%
986     \expandafter\bbl@tempb\bbl@tempa\@{}}

```

#### 4.5. Compatibility with language.def

Plain e-TeX doesn't rely on `language.dat`, but `babel` can be made compatible with this format easily.

```

987 \bbl@trace{Compatibility with language.def}
988 \ifx\directlua\@undefined\else
989   \ifx\bbl@luapatterns\@undefined
990     \input luababel.def
991   \fi
992 \fi
993 \ifx\bbl@languages\@undefined
994   \ifx\directlua\@undefined
995     \openin1 = language.def
996     \ifeof1
997       \closein1
998       \message{I couldn't find the file language.def}
999     \else
1000       \closein1
1001       \begingroup
1002         \def\addlanguage#1#2#3#4#5{%
1003           \expandafter\ifx\csname lang@#1\endcsname\relax\else
1004             \global\expandafter\let\csname l@#1\endcsname
1005               \csname lang@#1\endcsname
1006           \fi}%
1007         \def\uselanguage#1{%
1008           \input language.def
1009         \endgroup
1010       \fi
1011     \fi
1012   \chardef\l@english\z@
1013 \fi

```

**\addto** It takes two arguments, a *<control sequence>* and  $\TeX$ -code to be added to the *<control sequence>*.

If the *<control sequence>* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Note there is an inconsistency, because the assignment in the last branch is global.

```

1014 \def\addto#1#2{%
1015   \ifx#1\undefined
1016     \def#1{#2}%
1017   \else
1018     \ifx#1\relax
1019       \def#1{#2}%
1020     \else
1021       {\toks\expandafter{#1#2}%
1022        \xdef#1{\the\toks@}}%
1023   \fi
1024 \fi}

```

## 4.6. Hooks

Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is meant for developers, after all. `\bbl@usehooks` is the commands used by babel to execute hooks defined for an event.

```

1025 \bbl@trace{Hooks}
1026 \newcommand\AddBabelHook[3][]{%
1027   \bbl@iifunset\bbl@hk@#2{\EnableBabelHook{#2}}{%
1028     \def\bbl@tempa##1,##3=##2,##3\@empty{\def\bbl@tempb{##2}}%
1029     \expandafter\bbl@tempa\bbl@evargs,##3=,\@empty
1030     \bbl@iifunset\bbl@ev@#2@#3@#1{%
1031       {\bbl@csarg\bbl@add{ev@#3@#1}{\bbl@elth{#2}}}%
1032       {\bbl@csarg\let{ev@#2@#3@#1}\relax}%
1033     \bbl@csarg\newcommand{ev@#2@#3@#1}{\bbl@tempb}}
1034 \newcommand\EnableBabelHook[1]{\bbl@csarg\let{hk@#1}\@firstofone}
1035 \newcommand\DisableBabelHook[1]{\bbl@csarg\let{hk@#1}\@gobble}
1036 \def\bbl@usehooks{\bbl@usehooks@lang\language}
1037 \def\bbl@usehooks@lang#1#2#3{% Test for Plain
1038   \ifx\UseHook\undefined\else\UseHook{babel/*/#2}\fi
1039   \def\bbl@elth##1{%
1040     \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#3}}%
1041     \bbl@cs{ev@#2@#3}%
1042   \ifx\language\undefined\else % Test required for Plain (?)
1043     \ifx\UseHook\undefined\else\UseHook{babel/#1/#2}\fi
1044     \def\bbl@elth##1{%
1045       \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#2@#1@#3}}%
1046       \bbl@cs{ev@#2@#1}%
1047     \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for `hyphen.cfg` are also loaded (just in case you need them for some reason).

```

1048 \def\bbl@evargs{,% <- don't delete this comma
1049   everylanguage=1,loadkernel=1,loadpatterns=1,loadexceptions=1,%
1050   adddialect=2,patterns=2,defaultcommands=0,encodedcommands=2,write=0,%

1056   \bbl@foreach\bbl@evargs{\bbl@tempa#1\@@}
1057 \fi

```

Since the following command is meant for a hook (although a  $\mathTeX$  one), it's placed here.

```

1058 \providecommand\PassOptionsToLocale[2]{%
1059   \bbl@csarg\bbl@add@list{passto@#2}{#1}}

```

## 4.7. Setting up language files

**\LdfInit** \LdfInit macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the at-sign. We make sure that it is a ‘letter’ during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, ‘=’, because it is sometimes used in constructions with the \let primitive. Therefore we store its current catcode and restore it later on.

Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to \LdfInit is a control sequence. We do that by looking at the first token after passing #2 through string. When it is equal to \@backslashchar we are dealing with a control sequence which we can compare with \@undefined.

If so, we call \ldf@quit to set the main language, restore the category code of the @-sign and call \endinput

When #2 was *not* a control sequence we construct one and compare it with \relax.

Finally we check \originalTeX.

```
1060 \bbl@trace{Macros for setting language files up}

1111 \catcode`\==\eqcatcode \let\eqcatcode\relax}

```

After the preamble of the document the commands \LdfInit, \ldf@quit and \ldf@finish are no longer needed. Therefore they are turned into warning messages in *L<sup>A</sup>T<sub>E</sub>X*.

```

1112 \@onlypreamble\LdfInit
1113 \@onlypreamble\ldf@quit
1114 \@onlypreamble\ldf@finish

```

### **\main@language**

**\bbl@main@language** This command should be used in the various language definition files. It stores its argument in \bbl@main@language; to be used to switch to the correct language at the beginning of the document.

```

1115 \def\main@language#1{%
1116 \def\bbl@main@language{#1}%
1117 \let\language\name\bbl@main@language
1118 \let\localename\bbl@main@language
1119 \let\mainlocalename\bbl@main@language
1120 \bbl@id@assign
1121 \bbl@patterns{\language\name}}

```

We also have to make sure that some code gets executed at the beginning of the document, either when the aux file is read or, if it does not exist, when the \AtBeginDocument is executed. Languages do not set \pagedir, so we set here for the whole document to the main \bodydir.

The code written to the aux file attempts to avoid errors if babel is removed from the document.

```

1122 \def\bbl@beforestart{%

1151   \fi}

```

## 4.8. Shorthands

The macro `\initiate@active@char` below takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character. But first we define a little tool.

```

1152 \bbl@trace{Shorhands}
1153 \def\bbl@withactive#1#2{%
1154   \begingroup
1155     \lccode`~=#2\relax
1156     \lowercase{\endgroup#1~}}

```

**\bbl@add@special** The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if  $\TeX$  is used). It is used only at one place, namely when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional.

Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```

1157 \def\bbl@add@special#1{% 1:a macro like "\", \?, etc.
1158   \bbl@add\dospecials{\do#1}% test \@sanitize = \relax, for back. compat.
1159   \bbl@ifunset{\@sanitize}\{\bbl@add\@sanitize{\@makeother#1}}%
1160   \ifx\nfss@catcodes\undefined\else
1161     \begingroup
1162       \catcode`#1\active
1163       \nfss@catcodes
1164       \ifnum\catcode`#1=\active
1165         \endgroup
1166         \bbl@add\nfss@catcodes{\@makeother#1}%
1167       \else
1168         \endgroup
1169     \fi
1170   \fi}

```

**\initiate@active@char** A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char<char>` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char<char>` by default (`<char>` being the character to be made active). Later its definition can be changed to expand to `\active@char<char>` by calling `\bbl@activate{<char>}`.

For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines `"` as `\active@prefix "\active@char` (where the first `"` is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect "` or `\noexpand "` (i.e., with the original `"`); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (e.g., `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order, but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` defined as `\active@prefix "\normal@char`).

The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string’ed) character, `\<level>@group`, `\<level>@active` and `\<next-level>@active` (except in system).

```

1171 \def\bbl@active@def#1#2#3#4{%
1172   \@namedef{#3#1}{%
1173     \expandafter\ifx\csname#2@sh@#1@\endcsname\relax
1174       \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1175     \else
1176       \bbl@afterfi\csname#2@sh@#1@\endcsname
1177     \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1178   \long\@namedef{#3@arg#1}##1{%
1179     \expandafter\ifx\csname#2@sh@#1@\string##1@\endcsname\relax
1180       \bbl@afterelse\csname#4#1\endcsname##1%
1181     \else
1182       \bbl@afterfi\csname#2@sh@#1@\string##1@\endcsname
1183     \fi}}%

```

\initiate@active@char calls \@initiate@active@char with 3 arguments. All of them are the same character with different catcodes: active, other (\string'ed) and the original one. This trick simplifies the code a lot.

```

1184 \def\initiate@active@char#1{%
1185   \bbl@ifunset{active@char\string#1}%
1186   {\bbl@withactive
1187     {\expandafter\@initiate@active@char\expandafter}#1\string#1}%
1188   {}}

```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them \relax and preserving some degree of protection).

```

1189 \def\@initiate@active@char#1#2#3{%
1190   \bbl@csarg\edef{oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1191   \ifx#1\@undefined
1192     \bbl@csarg\def{oridef@#2}{\def#1{\active@prefix#1\@undefined}}%
1193   \else
1194     \bbl@csarg\let{oridef@#2}#1%
1195     \bbl@csarg\edef{oridef@#2}{%
1196       \let\noexpand#1%
1197       \expandafter\noexpand\csname bbl@oridef@#2\endcsname}%
1198   \fi

```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define \normal@char{char} to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example ') the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*").

```

1199   \ifx#1#3\relax
1200     \expandafter\let\csname normal@char#2\endcsname#3%
1201   \else
1202     \bbl@info{Making #2 an active character}%
1203     \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1204     \@namedef{normal@char#2}{%
1205       \textormath{#3}{\csname bbl@oridef@#2\endcsname}}%
1206   \else
1207     \@namedef{normal@char#2}{#3}%
1208   \fi

```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with KeepShorthandsActive). It is re-activate again at \begin{document}. We also need to make sure that the shorthands are active during the processing of the aux file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of \bibitem for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```

1209   \bbl@restoreactive{#2}%
1210   \AtBeginDocument{%

```

```

1211 \catcode`#2\active
1212 \if@filesw
1213 \immediate\write\@mainaux{\catcode`\string#2\active}%
1214 \fi}%
1215 \expandafter\bbbl@add@special\csname#2\endcsname
1216 \catcode`#2\active
1217 \fi

```

Now we have set `\normal@char⟨char⟩`, we must define `\active@char⟨char⟩`, to be executed when the character is activated. We define the first level expansion of `\active@char⟨char⟩` to check the status of the `@safe@actives` flag. If it is set to true we expand to the ‘normal’ version of this character, otherwise we call `\user@active⟨char⟩` to start the search of a definition in the user, language and system levels (or eventually `normal@char⟨char⟩`).

```

1218 \let\bbbl@tempa\@firstoftwo
1219 \if\string^#2%
1220 \def\bbbl@tempa{\noexpand\textormath}%
1221 \else
1222 \ifx\bbbl@mathnormal\undefined\else
1223 \let\bbbl@tempa\bbbl@mathnormal
1224 \fi
1225 \fi
1226 \expandafter\edef\csname active@char#2\endcsname{%
1227 \bbbl@tempa
1228 {\noexpand\if@safe@actives
1229 \noexpand\expandafter
1230 \expandafter\noexpand\csname normal@char#2\endcsname
1231 \noexpand\else
1232 \noexpand\expandafter
1233 \expandafter\noexpand\csname bbl@doactive#2\endcsname
1234 \noexpand\fi}%
1235 {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1236 \bbbl@csarg\edef{doactive#2}{%
1237 \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

$$\backslash active@prefix \langle char \rangle \backslash normal@char \langle char \rangle$$

(where `\active@char⟨char⟩` is *one* control sequence!).

```

1238 \bbbl@csarg\edef{active@#2}{%
1239 \noexpand\active@prefix\noexpand#1%
1240 \expandafter\noexpand\csname active@char#2\endcsname}%
1241 \bbbl@csarg\edef{normal@#2}{%
1242 \noexpand\active@prefix\noexpand#1%
1243 \expandafter\noexpand\csname normal@char#2\endcsname}%
1244 \bbbl@ncarg\let#1\bbbl@normal@#2}%

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn’t exist we check for a shorthand with an argument.

```

1245 \bbbl@active@def#2\user@group{user@active}{language@active}%
1246 \bbbl@active@def#2\language@group{language@active}{system@active}%
1247 \bbbl@active@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ‘ ’ ends up in a heading `TeX` would see `\protect'\protect'`. To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1248 \expandafter\edef\csname\user@group @sh#2@@\endcsname
1249 {\expandafter\noexpand\csname normal@char#2\endcsname}%
1250 \expandafter\edef\csname\user@group @sh#2@\string\protect\endcsname
1251 {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (') active we need to change `\prim@s` as well. Also, make sure that a single ' in math mode 'does the right thing'. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```
1252 \if\string'#2%
1253   \let\prim@s\bbl@prim@s
1254   \let\active@math@prime#1%
1255 \fi
1256 \bbl@usehooks{initiateactive}{\#1}{\#2}{\#3}}
```

The following package options control the behavior of shorthands in math mode.

```
1257 << *More package options >> ≡
1258 \DeclareOption{math=active}{}
1259 \DeclareOption{math=normal}{\def\bbl@mathnormal{\noexpand\textormath}}
1260 << /More package options >>
```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* the end of the *ldf*.

```
1261 \ifpackagewith{babel}{KeepShorthandsActive}%
1262   {\let\bbl@restoreactive\@gobble}%
1263   {\def\bbl@restoreactive#1{%
1264     \bbl@exp{%
1265       \\AfterBabelLanguage\\CurrentOption
1266       {\catcode`#1=\the\catcode`#1\relax}%
1267       \\AtEndOfPackage
1268       {\catcode`#1=\the\catcode`#1\relax}}}%
1269   \AtEndOfPackage{\let\bbl@restoreactive\@gobble}}
```

**\bbl@sh@select** This command helps the shorthand supporting macros to select how to proceed.

Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of `\hyphenation`.

This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either `\bbl@firstcs` or `\bbl@scndcs`. Hence two more arguments need to follow it.

```
1270 \def\bbl@sh@select#1#2{%
1271   \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1272     \bbl@afterelse\bbl@scndcs
1273   \else
1274     \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1275   \fi}
```

**\active@prefix** Used in the expansion of active characters has a function similar to `\OT1-cmd` in that it `\protects` the active character whenever `\protect` is *not* `\typeset@protect`. The `\@gobble` is needed to remove a token such as `\activechar`: (when the double colon was the active character to be dealt with). There are two definitions, depending of `\ifincsname` is available. If there is, the expansion will be more robust.

```
1276 \begingroup
1277 \bbl@ifunset{ifincsname}
1278   {\gdef\active@prefix#1{%
1279     \ifx\protect\@typeset@protect
1280     \else
1281       \ifx\protect\@unexpandable@protect
1282         \noexpand#1%
1283       \else
1284         \protect#1%
1285       \fi
1286       \expandafter\@gobble
1287     \fi}}
1288   {\gdef\active@prefix#1{%
1289     \ifincsname
```

```

1290     \string#1%
1291     \expandafter\@gobble
1292   \else
1293     \ifx\protect\@typeset@protect
1294     \else
1295       \ifx\protect\@unexpandable@protect
1296         \noexpand#1%
1297       \else
1298         \protect#1%
1299       \fi
1300     \expandafter\expandafter\expandafter\@gobble
1301   \fi
1302 \fi}}
1303 \endgroup

```

**\if@safe@actives** In some circumstances it is necessary to be able to reset the shorthand to its ‘normal’ value (usually the character with catcode ‘other’) on the fly. For this purpose the switch `@safe@actives` is available. The setting of this switch should be checked in the first level expansion of `\active@char⟨char⟩`. When this expansion mode is active (with `\@safe@activetrue`), something like `"13"13` becomes `"12"12` in an `\edef` (in other words, shorthands are `\string`’ed). This contrasts with `\protected@edef`, where catcodes are always left unchanged. Once converted, they can be used safely even after this expansion mode is deactivated (with `\@safe@activefalse`).

```

1304 \newif\if@safe@actives
1305 \@safe@activefalse

```

**\bbl@restore@actives** When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```

1306 \def\bbl@restore@actives{\if@safe@actives\@safe@activefalse\fi}

```

**\bbl@activate**

**\bbl@deactivate** Both macros take one argument, like `\initiate@active@char`. The macro is used to change the definition of an active character to expand to `\active@char⟨char⟩` in the case of `\bbl@activate`, or `\normal@char⟨char⟩` in the case of `\bbl@deactivate`.

```

1307 \chardef\bbl@activated\z@
1308 \def\bbl@activate#1{%
1309   \chardef\bbl@activated\@ne
1310   \bbl@withactive{\expandafter\let\expandafter}#1%
1311   \csname bbl@active@\string#1\endcsname}
1312 \def\bbl@deactivate#1{%
1313   \chardef\bbl@activated\tw@
1314   \bbl@withactive{\expandafter\let\expandafter}#1%
1315   \csname bbl@normal@\string#1\endcsname}

```

**\bbl@firstcs**

**\bbl@scndcs** These macros are used only as a trick when declaring shorthands.

```

1316 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1317 \def\bbl@scndcs#1#2{\csname#2\endcsname}

```

**\declare@shorthand** Used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e., ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e., `~` or `"a`;
3. the code to be executed when the shorthand is encountered.

The auxiliary macro `\babel@texpdf` improves the interoperativity with `hyperref` and takes 4 arguments: (1) The  $\TeX$  code in text mode, (2) the string for `hyperref`, (3) the  $\TeX$  code in math mode, and (4), which is currently ignored, but it’s meant for a string in math mode, like a minus sign instead of an hyphen (currently `hyperref` doesn’t discriminate the mode). This macro may be used in `ldf` files.

```

1318 \def\babel@texpdf#1#2#3#4{%

```

```

1319 \ifx\texorpdfstring\undefined
1320   \textormath{#1}{#3}%
1321 \else

1350     \@namedef{#1@sh@\string#2@\string#3@}{#4}%
1351   \fi}

```

**\textormath** Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro `\textormath` is provided.

```

1352 \def\textormath{%
1353   \ifmmode
1354     \expandafter\@secondoftwo
1355   \else
1356     \expandafter\@firstoftwo
1357   \fi}

```

**\user@group**

**\language@group**

**\system@group** The current concept of ‘shorthands’ supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group ‘english’ and have a system group called ‘system’.

```

1358 \def\user@group{user}
1359 \def\language@group{english}
1360 \def\system@group{system}

```

**\useshorthands** This is the user level macro. It initializes and activates the character for use as a shorthand character (i.e., it’s active in the preamble). Languages can deactivate shorthands, so a starred version is also provided which activates them always after the language has been switched.

```

1361 \def\useshorthands{%
1362   \@ifstar\bbl@usesh@s{\bbl@usesh@x{}}
1363 \def\bbl@usesh@s#1{%
1364   \bbl@usesh@x
1365   {\AddBabelHook{babel-sh-\string#1}{afterextras}}{\bbl@activate{#1}}}%
1366   {#1}}

```

```

1367 \def\bbl@usesh@x#1#2{%
1368   \bbl@ifshorthand{#2}%

**\@notshorthand**

```

1411 \def\@notshorthand#1{\bbl@error{not-a-shorthand}{#1}{}}

```

## **\shorthandon**

**\shorthandoff** The first level definition of these macros just passes the argument on to `\bbl@switch@sh`, adding `\@nnil` at the end to denote the end of the list of characters.

```
1412 \newcommand*\shorthandon[1]{\bbl@switch@sh\@ne#1\@nnil}
1413 \DeclareRobustCommand*\shorthandoff{%
1414   \ifstar{\bbl@shorthandoff\tw@}{\bbl@shorthandoff\z@}}
1415 \def\bbl@shorthandoff#1#2{\bbl@switch@sh#1#2\@nnil}
```

**\bbl@switch@sh** The macro `\bbl@switch@sh` takes the list of characters apart one by one and subsequently switches the category code of the shorthand character according to the first argument of `\bbl@switch@sh`.

But before any of this switching takes place we make sure that the character we are dealing with is known as a shorthand character. If it is, a macro such as `\active@char` should exist.

Switching off and on is easy – we just set the category code to ‘other’ (12) and `\active`. With the starred version, the original catcode and the original definition, saved in `@initiate@active@char`, are restored.

```
1416 \def\bbl@switch@sh#1#2{%
1417   \ifx#2\@nnil\else

1468 \fi

```

You may want to test if a character is a shorthand. Note it does not test whether the shorthand is on or off.

```

1469 \newcommand\ifbabelshorthand[3]{\bbl@ifunset{\bbl@active@string#1}{#3}{#2}}

```

## **\bbl@prim@s**

**\bbl@pr@m@s** One of the internal macros that are involved in substituting `\prime` for each right quote in mathmode is `\prim@s`. This checks if the next character is a right quote. When the right quote is active, the definition of this macro needs to be adapted to look also for an active right quote; the hat could be active, too.

```

1470 \def\bbl@prim@s{%
1471 \prime\futurelet\@let@token\bbl@pr@m@s}
1472 \def\bbl@if@primes#1#2{%
1473 \ifx#1\@let@token
1474 \expandafter\@firstoftwo
1475 \else\ifx#2\@let@token
1476 \bbl@afterelse\expandafter\@firstoftwo
1477 \else
1478 \bbl@afterfi\expandafter\@secondoftwo
1479 \fi\fi}
1480 \begingroup
1481 \catcode`\^=7 \catcode`\*=\active \lccode`\*='\^
1482 \catcode`\'=12 \catcode`\"=\active \lccode`\"='\ '
1483 \lowercase{%
1484 \gdef\bbl@pr@m@s{%
1485 \bbl@if@primes" '%
1486 \pr@@@s
1487 {\bbl@if@primes*^\pr@@@t\egroup}}}
1488 \endgroup

```

Usually the `~` is active and expands to `\penalty\@M\_{}`. When it is written to the aux file it is written expanded. To prevent that and to be able to use the character `~` as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when `~` is still a non-break space), and in some cases is inconvenient (if `~` has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the babel value).

```

1489 \initiate@active@char{~}
1490 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
1491 \bbl@activate{~}

```

## **\OT1dqpos**

**\T1dqpos** The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the `\f@encoding` macro. Therefore we define two macros here to store the position of the character in these encodings.

```

1492 \expandafter\def\csname OT1dqpos\endcsname{127}
1493 \expandafter\def\csname T1dqpos\endcsname{4}

```

When the macro `\f@encoding` is undefined (as it is in plain  $\TeX$ ) we define it here to expand to OT1

```

1494 \ifx\f@encoding\undefined
1495 \def\f@encoding{OT1}
1496 \fi

```

## 4.9. Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

**\languageattribute** The macro `\languageattribute` checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```
1497 \bbl@trace{Language attributes}
1498 \newcommand\languageattribute[2]{%
1499   \def\bbl@tempc{#1}%
1500   \bbl@fixname\bbl@tempc
1501   \bbl@iflanguage\bbl@tempc{%
1502     \bbl@vforeach{#2}{%
```

To make sure each attribute is selected only once, we store the already selected attributes in `\bbl@known@attrs`. When that control sequence is not yet defined this attribute is certainly not selected before.

```
1503     \ifx\bbl@known@attrs\undefined
1504       \in@false
1505     \else
1506       \bbl@xin@{,\bbl@tempc-##1,}{,\bbl@known@attrs,}%
1507     \fi
1508     \ifin@
1509       \bbl@warning{%
1510         You have more than once selected the attribute '##1'\%
1511         for language #1. Reported}%
1512     \else
```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated  $\TeX$ -code.

```
1513       \bbl@info{Activated '##1' attribute for\%
1514         '\bbl@tempc'. Reported}%
1515       \bbl@exp{%
1516         \\bbl@add@list\\bbl@known@attrs{\bbl@tempc-##1}}%
1517       \edef\bbl@tempa{\bbl@tempc-##1}%
1518       \expandafter\bbl@ifknown@ttrib\expandafter{\bbl@tempa}\bbl@attributes%
1519       {\csname\bbl@tempc @attr##1\endcsname}%
1520       {\@attrerr{\bbl@tempc}{##1}}%
1521     \fi}}
1522 \@onlypreamble\languageattribute
```

The error text to be issued when an unknown attribute is selected.

```
1523 \newcommand*\@attrerr[2]{%
1524   \bbl@error{unknown-attribute}{#1}{#2}{}}
```

**\bbl@declare@ttribute** This command adds the new language/attribute combination to the list of known attributes.

Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro `\extras...` for the current language is extended, otherwise the attribute will not work as its code is removed from memory at `\begin{document}`.

```
1525 \def\bbl@declare@ttribute#1#2#3{%
1526   \bbl@xin@{,#2,}{,\BabelModifiers,}%
1527   \ifin@
1528     \AfterBabelLanguage{#1}{\languageattribute{#1}{#2}}%
1529   \fi
1530   \bbl@add@list\bbl@attributes{#1-#2}%
1531   \expandafter\def\csname#1@attr@#2\endcsname{#3}}
```

**\bbl@ifattributeset** This internal macro has 4 arguments. It can be used to interpret  $\TeX$  code based on whether a certain attribute was set. This command should appear inside the argument to `\AtBeginDocument` because the attributes are set in the document preamble, *after* babel is loaded.

The first argument is the language, the second argument the attribute being checked, and the third and fourth arguments are the true and false clauses.

```

1532 \def\bbl@ifattributeset#1#2#3#4{%
1533   \ifx\bbl@known@attribs\@undefined
1534     \in@false
1535   \else
1536     \bbl@xin@{,#1-#2,}{,\bbl@known@attribs,}%
1537   \fi
1538   \ifin@
1539     \bbl@afterelse#3%
1540   \else
1541     \bbl@afterfi#4%
1542   \fi}

```

**\bbl@ifknown@ttrib** An internal macro to check whether a given language/attribute is known. The macro takes 4 arguments, the language/attribute, the attribute list, the  $\TeX$ -code to be executed when the attribute is known and the  $\TeX$ -code to be executed otherwise.

We first assume the attribute is unknown. Then we loop over the list of known attributes, trying to find a match.

```

1543 \def\bbl@ifknown@ttrib#1#2{%
1544   \let\bbl@tempa\@secondoftwo
1545   \bbl@loopx\bbl@tempb{#2}{%
1546     \expandafter\in@\expandafter{\expandafter,\bbl@tempb,}{,#1,}%
1547   \ifin@
1548     \let\bbl@tempa\@firstoftwo
1549   \else
1550     \fi}%
1551   \bbl@tempa}

```

**\bbl@clear@ttribs** This macro removes all the attribute code from  $\TeX$ 's memory at `\begin{document}` time (if any is present).

```

1552 \def\bbl@clear@ttribs{%
1553   \ifx\bbl@attributes\@undefined\else
1554     \bbl@loopx\bbl@tempa{\bbl@attributes}{%
1555       \expandafter\bbl@clear@ttrib\bbl@tempa.}%
1556     \let\bbl@attributes\@undefined
1557   \fi}
1558 \def\bbl@clear@ttrib#1-#2.{%
1559   \expandafter\let\csname#1@attr@#2\endcsname\@undefined}
1560 \AtBeginDocument{\bbl@clear@ttribs}

```

## 4.10. Support for saving and redefining macros

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are *\relax*'ed.

**\babel@savecnt**

**\babel@beginsave** The initialization of a new save cycle: reset the counter to zero.

```

1561 \bbl@trace{Macros for saving definitions}
1562 \def\babel@beginsave{\babel@savecnt\z@}

    Before it's forgotten, allocate the counter and initialize all.

1563 \newcount\babel@savecnt
1564 \babel@beginsave

```

### **\babel@save**

**\babel@savevariable** The macro `\babel@save⟨csname⟩` saves the current meaning of the control sequence `⟨csname⟩` to `\originalTeX` (which has to be expandable, i.e., you shouldn't let it to `\relax`). To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable⟨variable⟩` saves the value of the variable. `⟨variable⟩` can be anything allowed after the `\the` primitive. To avoid messing saved definitions up, they are saved only the very first time.

```
1565 \def\babel@save#1{%
1566   \def\bbl@tempa{,{#1,}}% Clumsy, for Plain
1567   \expandafter\bbl@add\expandafter\bbl@tempa\expandafter{%
1568     \expandafter\expandafter,\bbl@savedextras,}%
1569   \expandafter\in@\bbl@tempa
1570   \ifin@%else
1571     \bbl@add\bbl@savedextras{,{#1,}}%
1572     \bbl@carg\let\babel@number\babel@savecnt#1\relax
1573     \toks@{\expandafter{\originalTeX\let#1=}}%
1574     \bbl@exp{%
1575       \def\\originalTeX{\the\toks@<\babel@number\babel@savecnt>\relax}}%
1576     \advance\babel@savecnt@one
1577   \fi}
1578 \def\babel@savevariable#1{%
1579   \toks@{\expandafter{\originalTeX #1=}}%
1580   \bbl@exp{\def\\originalTeX{\the\toks@\\the#1\relax}}}
```

**\bbl@redefine** To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don't want to redefine the  $\TeX$  macros completely in case their definitions change (they have changed in the past). A macro named `\macro` will be saved new control sequences named `\org@macro`.

```
1581 \def\bbl@redefine#1{%
1582   \edef\bbl@tempa{\bbl@stripslash#1}%
1583   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1584   \expandafter\def\csname\bbl@tempa\endcsname}
1585 \@onlypreamble\bbl@redefine
```

**\bbl@redefine@long** This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```
1586 \def\bbl@redefine@long#1{%
1587   \edef\bbl@tempa{\bbl@stripslash#1}%
1588   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1589   \long\expandafter\def\csname\bbl@tempa\endcsname}
1590 \@onlypreamble\bbl@redefine@long
```

**\bbl@redefineroobust** For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo_`. So it is necessary to check whether `\foo_` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo_`.

```
1591 \def\bbl@redefineroobust#1{%
1592   \edef\bbl@tempa{\bbl@stripslash#1}%
1593   \bbl@ifunset{\bbl@tempa\space}%
1594     {\expandafter\let\csname org@\bbl@tempa\endcsname#1%
1595       \bbl@exp{\def\\#1{\\protect<\bbl@tempa\space>}}}%
1596     {\bbl@exp{\let<org@\bbl@tempa><\bbl@tempa\space>}}}%
1597   \@namedef{\bbl@tempa\space}}
1598 \@onlypreamble\bbl@redefineroobust
```

## 4.11. French spacing

### **\bbl@frenchspacing**

**\bbl@nonfrenchspacing** Some languages need to have \frenchspacing in effect. Others don't want that. The command \bbl@frenchspacing switches it on when it isn't already in effect and \bbl@nonfrenchspacing switches it off if necessary.

```

1599 \def\bbl@frenchspacing{%
1600   \ifnum\the\sfcode`\.\=@m
1601     \let\bbl@nonfrenchspacing\relax
1602   \else
1603     \frenchspacing
1604     \let\bbl@nonfrenchspacing\nonfrenchspacing
1605   \fi}
1606 \let\bbl@nonfrenchspacing\nonfrenchspacing

```

A more refined way to switch the catcodes is done with ini files. Here an auxiliary macro is defined, but the main part is in \babelprovide. This new method should be ideally the default one.

```

1607 \let\bbl@elt\relax
1608 \edef\bbl@fs@chars{%
1609   \bbl@elt{\string.}\@m{3000}\bbl@elt{\string?}\@m{3000}%
1610   \bbl@elt{\string!}\@m{3000}\bbl@elt{\string:}\@m{2000}%
1611   \bbl@elt{\string;}\@m{1500}\bbl@elt{\string,}\@m{1250}}
1612 \def\bbl@pre@fs{%
1613   \def\bbl@elt##1##2##3{\sfcode`##1=\the\sfcode`##1\relax}%
1614   \edef\bbl@save@sfcodes{\bbl@fs@chars}}%
1615 \def\bbl@post@fs{%
1616   \bbl@save@sfcodes
1617   \edef\bbl@tempa{\bbl@cl{frspc}}%
1618   \edef\bbl@tempa{\expandafter\@car\bbl@tempa\@nil}%
1619   \if u\bbl@tempa      % do nothing
1620   \else\if n\bbl@tempa % non french
1621     \def\bbl@elt##1##2##3{%
1622       \ifnum\sfcode`##1=##2\relax
1623         \babel@savevariable{\sfcode`##1}%
1624         \sfcode`##1=##3\relax
1625       \fi}%
1626     \bbl@fs@chars
1627   \else\if y\bbl@tempa % french
1628     \def\bbl@elt##1##2##3{%
1629       \ifnum\sfcode`##1=##3\relax
1630         \babel@savevariable{\sfcode`##1}%
1631         \sfcode`##1=##2\relax
1632       \fi}%
1633     \bbl@fs@chars
1634   \fi\fi\fi}

```

## 4.12. Hyphens

**\babelhyphenation** This macro saves hyphenation exceptions. Two macros are used to store them: \bbl@hyphenation@ for the global ones and \bbl@hyphenation@<language> for language ones. See \bbl@patterns above for further details. We make sure there is a space between words when multiple commands are used.

```

1635 \bbl@trace{Hyphens}
1636 \@onlypreamble\babelhyphenation
1637 \AtEndOfPackage{%
1638   \newcommand\babelhyphenation[2][\@empty]{%
1639     \ifx\bbl@hyphenation@\relax
1640       \let\bbl@hyphenation@\@empty
1641     \fi
1642     \ifx\bbl@hyphlist\@empty\else
1643       \bbl@warning{%
1644         You must not intermingle \string\selectlanguage\space and\\%
1645         \string\babelhyphenation\space or some exceptions will not\\%
1646         be taken into account. Reported}%
1647     \fi

```

```

1648 \ifx\@empty#1%
1649 \protected@edef\bb@hyphenation@\bb@hyphenation\space#2}%
1650 \else
1651 \bb@vforeach{#1}{%
1652 \def\bb@tempa{##1}%
1653 \bb@fixname\bb@tempa
1654 \bb@iflanguage\bb@tempa{%
1655 \bb@csarg\protected@edef\hyphenation@\bb@tempa}{%
1656 \bb@ifunset\bb@hyphenation@\bb@tempa}%
1657 }%
1658 {\csname \bb@hyphenation@\bb@tempa\endcsname\space}%
1659 #2}}}%
1660 \fi}}

```

**\babelhyphenmins** Only L<sup>A</sup>T<sub>E</sub>X (basically because it's defined with a L<sup>A</sup>T<sub>E</sub>X tool).

```

1661 \ifx\NewDocumentCommand\@undefined\else
1662 \NewDocumentCommand\babelhyphenmins{sommo}{%
1663 \IfNoValueTF{#2}%
1664 {\protected@edef\bb@hyphenmins@\set@hyphenmins{#3}{#4}}%
1665 \IfValueT{#5}{%
1666 \protected@edef\bb@hyphenatmin@\hyphenationmin=#5\relax}}%
1667 \IfBooleanT{#1}{%
1668 \leftthyphenmin=#3\relax
1669 \rightthyphenmin=#4\relax
1670 \IfValueT{#5}{\hyphenationmin=#5\relax}}}%
1671 {\edef\bb@tempb{\zap@space#2 \@empty}%
1672 \bb@for\bb@tempa\bb@tempb{%
1673 \namedef\bb@hyphenmins@\bb@tempa}{\set@hyphenmins{#3}{#4}}%
1674 \IfValueT{#5}{%
1675 \namedef\bb@hyphenatmin@\bb@tempa}{\hyphenationmin=#5\relax}}}%
1676 \IfBooleanT{#1}{\bb@error{hyphenmins-args}{}}}%
1677 \fi

```

**\bb@allowhyphens** This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak\hskip 0pt plus 0pt`. T<sub>E</sub>X begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

```

1678 \def\bb@allowhyphens{\ifvmode\else\nobreak\hskip\zap@skip\fi}
1679 \def\bb@t@one{T1}
1680 \def\allowhyphens{\ifx\cf@encoding\bb@t@one\else\bb@allowhyphens\fi}

```

**\babelhyphen** Macros to insert common hyphens. Note the space before @ in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@` prefix.

```

1681 \newcommand\babelnullhyphen{\char\hyphenchar\font}
1682 \def\babelhyphen{\active@prefix\babelhyphen\bb@hyphen}
1683 \def\bb@hyphen{%
1684 \@ifstar{\bb@hyphen@i @}{\bb@hyphen@i \@empty}}
1685 \def\bb@hyphen@i#1#2{%
1686 \lowercase{\bb@ifunset\bb@hy@#1#2\@empty}}%
1687 {\csname \bb@lusehyphen\endcsname{\discretionary{#2}{}{#2}}}%
1688 {\lowercase{\csname \bb@hy@#1#2\@empty\endcsname}}}

```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single @ is used when further hyphenation is allowed, while that with @@ if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”. `\nobreak` is always preceded by `\leavevmode`, in case the shorthand starts a paragraph.

```

1689 \def\bb@usehyphen#1{%
1690 \leavevmode

```

```

1691 \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
1692 \nobreak\hskip\z@skip}
1693 \def\bbl@usehyphen#1{%
1694 \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}

```

The following macro inserts the hyphen char.

```

1695 \def\bbl@hyphenchar{%
1696 \ifnum\hyphenchar\font=\m@ne
1697 \babe\nullhyphen
1698 \else
1699 \char\hyphenchar\font
1700 \fi}

```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in `ldf`’s. After a space, the `\mbox` in `\bbl@hy@nobreak` is redundant.

```

1701 \def\bbl@hy@soft{\bbl@usehyphen\discretionary{\bbl@hyphenchar}{}}{}
1702 \def\bbl@hy@@soft{\bbl@usehyphen\discretionary{\bbl@hyphenchar}{}}{}
1703 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
1704 \def\bbl@hy@@hard{\bbl@usehyphen\bbl@hyphenchar}
1705 \def\bbl@hy@nobreak{\bbl@usehyphen\mbox{\bbl@hyphenchar}}
1706 \def\bbl@hy@nobreak{\mbox{\bbl@hyphenchar}}
1707 \def\bbl@hy@repeat{%
1708 \bbl@usehyphen{
1709 \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}
1710 \def\bbl@hy@@repeat{%
1711 \bbl@usehyphen{
1712 \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}
1713 \def\bbl@hy@empty{\hskip\z@skip}
1714 \def\bbl@hy@@empty{\discretionary{}{}{}}

```

**\bbl@disc** For some languages the macro `\bbl@disc` is used to ease the insertion of discretionaries for letters that behave ‘abnormally’ at a breakpoint.

```

1715 \def\bbl@disc#1#2{\nobreak\discretionary{#2-}{}{#1}\bbl@allowhyphens}

```

## 4.13. Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by `luatex` and `xetex`. The code is organized here with pseudo-guards, so we start with the basic commands.

**Tools** But first, a tool. It makes global a local variable. This is not the best solution, but it works.

```

1716 \bbl@trace{Multiencoding strings}
1717 \def\bbl@tglobal#1{\global\let#1#1}

```

The following option is currently no-op. It was meant for the deprecated `\SetCase`.

```

1718 << *More package options[] ≡
1719 \DeclareOption{nocase}{}
1720 <</More package options[]

```

The following package options control the behavior of `\SetString`.

```

1721 << *More package options[] ≡
1722 \let\bbl@opt@strings\@nnil % accept strings=value
1723 \DeclareOption{strings}{\def\bbl@opt@strings{\BabelStringsDefault}}
1724 \DeclareOption{strings=encoded}{\let\bbl@opt@strings\relax}
1725 \def\BabelStringsDefault{generic}
1726 <</More package options[]

```

**Main command** This is the main command. With the first use it is redefined to omit the basic setup in subsequent blocks. We make sure strings contain actual letters in the range 128-255, not active characters.

```

1727 \onlypreamble\StartBabelCommands
1728 \def\StartBabelCommands{%
1729   \begingroup
1730   \@tempcnta="7F

```

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (i.e., fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (i.e., no strings or a block whose label is not in strings=) do nothing.

We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

```

```

There are two versions of `\bbl@scswitch`. The first version is used when `ldfs` are read, and it makes sure `\(group)(language)` is reset, but only once (`\bbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after `babel` and does nothing.

The macro `\bbl@forlang` loops `\bbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date(language)` is defined (after `babel` has been loaded). There are also two version of `\bbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `ldfs`), and the second one skips undefined languages (after `babel` has been loaded).

```

1824 \def\bbl@forlang#1#2{%

1847 \endgroup
1848 \bbl@scafter}
1849 \let\bbl@endcommands\EndBabelCommands

```

Now we define commands to be used inside \StartBabelCommands.

**Strings** The following macro is the actual definition of \SetString when it is “active”

First save the “switcher”. Create it if undefined. Strings are defined only if undefined (i.e., like \providescommand). With the event stringprocess you can preprocess the string by manipulating the value of \BabelString. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

1850 \def\bbl@setstring#1#2{% e.g., \prefacename{<string>}
1851 \bbl@forlang\bbl@tempa{%
1852 \edef\bbl@LC{\bbl@tempa\bbl@stripslash#1}%
1853 \bbl@ifunset{\bbl@LC}% e.g., \germanchaptername
1854 {\bbl@exp{%
1855 \global\bbbl@add\<\bbl@G\bbl@tempa>{\bbbl@scset\#1\<\bbl@LC>}}}%
1856 }%
1857 \def\BabelString{#2}%
1858 \bbl@usehooks{stringprocess}{}}%
1859 \expandafter\bbl@stringdef
1860 \csname\bbl@LC\expandafter\endcsname\expandafter{\BabelString}}

```

A little auxiliary command sets the string. Formerly used with casing. Very likely no longer necessary, although it’s used in \setlocalecaption.

```

1861 \def\bbl@scset#1#2{\def#1{#2}}

```

Define \SetStringLoop, which is actually set inside \StartBabelCommands. The current definition is somewhat complicated because we need a count, but \count@ is not under our control (remember \SetString may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

1862 << *Macros local to BabelCommands >> ≡
1863 \def\SetStringLoop##1##2{%
1864 \def\bbl@templ####1{\expandafter\noexpand\csname##1\endcsname}%
1865 \count@\z@

## 4.15. Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through Tlenc.def.

**\set@low@box** The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```

1987 \bbl@trace{Macros related to glyphs}
1988 \def\set@low@box#1{\setbox\tw@hbox{,}\setbox\z@hbox{#1}%
1989 \dimen\z@ht\z@ \advance\dimen\z@ -\ht\tw@%
1990 \setbox\z@hbox{\lower\dimen\z@ \box\z@}\ht\z@ht\tw@ \dp\z@dp\tw@}

```

**\save@sf@q** The macro \save@sf@q is used to save and reset the current space factor.

```

1991 \def\save@sf@q#1{\leavevmode
1992 \begingroup
1993 \edef\@SF{\spacefactor\the\spacefactor}#1\@SF
1994 \endgroup}

```

### 4.15.1. Quotation marks

**\quotedblbase** In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via \quotedblbase. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```

1995 \ProvideTextCommand{\quotedblbase}{OT1}{%
1996 \save@sf@q{\set@low@box{\textquotedblright\}}%
1997 \box\z@\kern-.04em\bbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

1998 \ProvideTextCommandDefault{\quotedblbase}{%
1999 \UseTextSymbol{OT1}{\quotedblbase}}

```

**\quotesinglbase** We also need the single quote character at the baseline.

```

2000 \ProvideTextCommand{\quotesinglbase}{OT1}{%
2001 \save@sf@q{\set@low@box{\textquoteright\}}%
2002 \box\z@\kern-.04em\bbl@allowhyphens}}

```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```

2003 \ProvideTextCommandDefault{\quotesinglbase}{%
2004 \UseTextSymbol{OT1}{\quotesinglbase}}

```

**\guillemetleft**

**\guillemetright** The guillemet characters are not available in OT1 encoding. They are faked. (Wrong names with o preserved for compatibility.)

```

2005 \ProvideTextCommand{\guillemetleft}{OT1}{%
2006 \ifmmode
2007 \ll
2008 \else
2009 \save@sf@q{\nobreak
2010 \raise.2ex\hbox{\scriptscriptstyle\ll}\bbl@allowhyphens}%
2011 \fi}

2031 \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2032 \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2033 \ProvideTextCommandDefault{\guillemetleft}{%
2034 \UseTextSymbol{OT1}{\guillemetleft}}
2035 \ProvideTextCommandDefault{\guillemetright}{%
2036 \UseTextSymbol{OT1}{\guillemetright}}
2037 \ProvideTextCommandDefault{\guillemotleft}{%
2038 \UseTextSymbol{OT1}{\guillemotleft}}
2039 \ProvideTextCommandDefault{\guillemotright}{%
2040 \UseTextSymbol{OT1}{\guillemotright}}

```

#### **\guilsinglleft**

**\guilsinglright** The single guillemets are not available in OT1 encoding. They are faked.

```

2041 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2042 \ifmmode
2043 <%
2044 \else
2045 \save@sf@q{\nobreak
2046 \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2047 \fi}
2048 \ProvideTextCommand{\guilsinglright}{OT1}{%
2049 \ifmmode
2050 >%
2051 \else
2052 \save@sf@q{\nobreak
2053 \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2054 \fi}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2055 \ProvideTextCommandDefault{\guilsinglleft}{%
2056 \UseTextSymbol{OT1}{\guilsinglleft}}
2057 \ProvideTextCommandDefault{\guilsinglright}{%
2058 \UseTextSymbol{OT1}{\guilsinglright}}

```

## **4.15.2. Letters**

### **\ij**

**\IJ** The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefore we fake it for the OT1 encoding.

```

2059 \DeclareTextCommand{\ij}{OT1}{%
2060 i\kern-0.02em\bbl@allowhyphens j}
2061 \DeclareTextCommand{\IJ}{OT1}{%
2062 I\kern-0.02em\bbl@allowhyphens J}
2063 \DeclareTextCommand{\ij}{T1}{\char188}
2064 \DeclareTextCommand{\IJ}{T1}{\char156}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2065 \ProvideTextCommandDefault{\ij}{%
2066   \UseTextSymbol{OT1}{\ij}}
2067 \ProvideTextCommandDefault{\IJ}{%
2068   \UseTextSymbol{OT1}{\IJ}}
```

**\dj**

**\DJ** The croatian language needs the letters \dj and \DJ; they are available in the T1 encoding, but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```
2069 \def\crrtic@{\hrule height0.1ex width0.3em}
2070 \def\crttic@{\hrule height0.1ex width0.33em}
2071 \def\ddj@{%
2072   \setbox0\hbox{d}\dimen@=\ht0
2073   \advance\dimen@lex
2074   \dimen@.45\dimen@
2075   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2076   \advance\dimen@ii.5ex
2077   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2078 \def\DDJ@{%
2079   \setbox0\hbox{D}\dimen@=.55\ht0
2080   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2081   \advance\dimen@ii.15ex % correction for the dash position
2082   \advance\dimen@ii-.15\fontdimen7\font % correction for cmtt font
2083   \dimen\thr@@\expandafter\rem@pt\the\fontdimen7\font\dimen@
2084   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crttic@}}}}
2085 %
2086 \DeclareTextCommand{\dj}{OT1}{\ddj@ d}
2087 \DeclareTextCommand{\DJ}{OT1}{\DDJ@ D}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2088 \ProvideTextCommandDefault{\dj}{%
2089   \UseTextSymbol{OT1}{\dj}}
2090 \ProvideTextCommandDefault{\DJ}{%
2091   \UseTextSymbol{OT1}{\DJ}}
```

**\SS** For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefore we make it available here.

```
2092 \DeclareTextCommand{\SS}{OT1}{SS}
2093 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{OT1}{\SS}}
```

### 4.15.3. Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode. They are defined with \ProvideTextCommandDefault, but this is very likely not required because their definitions are based on encoding-dependent macros.

**\glq**

**\grq** The ‘german’ single quotes.

```
2094 \ProvideTextCommandDefault{\glq}{%
2095   \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}
```

The definition of \grq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```
2096 \ProvideTextCommand{\grq}{T1}{%
2097   \textormath{\kern\z@\textquoteleft}{\mbox{\textquoteleft}}}}
2098 \ProvideTextCommand{\grq}{TU}{%
2099   \textormath{\textquoteleft}{\mbox{\textquoteleft}}}}
2100 \ProvideTextCommand{\grq}{OT1}{%
2101   \save@sf@q{\kern-.0125em
2102     \textormath{\textquoteleft}{\mbox{\textquoteleft}}}%
2103   }
```

```

2103 \kern.07em\relax}}
2104 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{0T1}\grq}

```

#### **\glqq**

**\grqq** The ‘german’ double quotes.

```

2105 \ProvideTextCommandDefault{\glqq}{%
2106 \textormath{\quotedblbase}{\mbox{\quotedblbase}}}

```

The definition of \grqq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2107 \ProvideTextCommand{\grqq}{T1}{%
2108 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2109 \ProvideTextCommand{\grqq}{TU}{%
2110 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2111 \ProvideTextCommand{\grqq}{0T1}{%
2112 \save@sf@q{\kern-.07em
2113 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2114 \kern.07em\relax}}
2115 \ProvideTextCommandDefault{\grqq}{\UseTextSymbol{0T1}\grqq}

```

#### **\flq**

**\frq** The ‘french’ single guillemets.

```

2116 \ProvideTextCommandDefault{\flq}{%
2117 \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
2118 \ProvideTextCommandDefault{\frq}{%
2119 \textormath{\guilsinglright}{\mbox{\guilsinglright}}}

```

#### **\flqq**

**\frqq** The ‘french’ double guillemets.

```

2120 \ProvideTextCommandDefault{\flqq}{%
2121 \textormath{\guillemetleft}{\mbox{\guillemetleft}}}
2122 \ProvideTextCommandDefault{\frqq}{%
2123 \textormath{\guillemetright}{\mbox{\guillemetright}}}

```

### 4.15.4. Umlauts and tremas

The command \~ needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

#### **\umlauthigh**

**\umlautlow** To be able to provide both positions of \~ we provide two commands to switch the positioning, the default will be \umlauthigh (the normal positioning).

```

2124 \def\umlauthigh{%
2125 \def\bbl@umlauta##1{\leavevmode\bgroup%
2126 \accent\csname\f@encoding dqpos\endcsname
2127 ##1\bbl@allowhyphens\egroup}%
2128 \let\bbl@umlaute\bbl@umlauta}
2129 \def\umlautlow{%
2130 \def\bbl@umlauta{\protect\lower@umlaut}}
2131 \def\umlautelow{%
2132 \def\bbl@umlaute{\protect\lower@umlaut}}
2133 \umlauthigh

```

**\lower@umlaut** Used to position the \" closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *(dimen)* register.

```
2134 \expandafter\ifx\csname U@D\endcsname\relax
2135   \csname newdimen\endcsname\U@D
2136 \fi
```

The following code fools  $\TeX$ 's `make_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we'll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```
2137 \def\lower@umlaut#1{%
2138   \leavevmode\bgroup
2139     \U@D lex%
2140     {\setbox\z@\hbox{%
2141       \char\csname f@encoding dqpos\endcsname}%
2142       \dimen@ -.45ex\advance\dimen@ \ht\z@
2143       \ifdim lex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2144     \accent\csname f@encoding dqpos\endcsname
2145     \fontdimen5\font\U@D #1%
2146   \egroup}
```

For all vowels we declare \" to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```
2147 \AtBeginDocument{%
2148   \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2149   \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%
2150   \DeclareTextCompositeCommand{\}{OT1}{i}{\bbl@umlaute{i}}%
2151   \DeclareTextCompositeCommand{\}{OT1}{\i}{\bbl@umlaute{\i}}%
2152   \DeclareTextCompositeCommand{\}{OT1}{o}{\bbl@umlauta{o}}%
2153   \DeclareTextCompositeCommand{\}{OT1}{u}{\bbl@umlauta{u}}%
2154   \DeclareTextCompositeCommand{\}{OT1}{A}{\bbl@umlauta{A}}%
2155   \DeclareTextCompositeCommand{\}{OT1}{E}{\bbl@umlaute{E}}%
2156   \DeclareTextCompositeCommand{\}{OT1}{I}{\bbl@umlaute{I}}%
2157   \DeclareTextCompositeCommand{\}{OT1}{O}{\bbl@umlauta{O}}%
2158   \DeclareTextCompositeCommand{\}{OT1}{U}{\bbl@umlauta{U}}}
```

Finally, make sure the default hyphenrules are defined (even if empty). For internal use, another empty `\language` is defined. Currently used in `Amharic`.

```
2159 \ifx\l@english\@undefined
2160   \chardef\l@english\z@
2161 \fi
2162 % The following is used to cancel rules in ini files (see Amharic).
2163 \ifx\l@unhyphenated\@undefined
2164   \newlanguage\l@unhyphenated
2165 \fi
```

## 4.16. Layout

Layout is mainly intended to set bidi documents, but there is at least a tool useful in general.

```
2166 \bbl@trace{Bidi layout}
2167 \providecommand\IfBabelLayout[3]{#3}%
```

## 4.17. Load engine specific macros

Some macros are not defined in all engines, so, after loading the files define them if necessary to raise an error.

```
2168 \bbl@trace{Input engine specific macros}
2169 \ifcase\bbl@engine
2170   \input txtbabel.def
2171 \or
2172   \input luababel.def
2173 \or

2180   \let\babelpatterns\babelprehyphenation
2181   \let\babelcharproperty\babelprehyphenation
2182 \fi
2183 \end{package} | core
```

## 4.18. Creating and modifying languages

Continue with  $\LaTeX$  only.

`\babelprovide` is a general purpose tool for creating and modifying languages. It creates the language infrastructure, and loads, if requested, an ini file. It may be used in conjunction to previously loaded `ldf` files.

```
2184 \begin{package}
2185 \bbl@trace{Creating languages and reading ini files}
2186 \let\bbl@extend@ini@gobble

## 4.19. Main loop in ‘provide’

Now, the ‘main loop’, `\bbl@read@ini`, which **must be executed inside a group**. At this point, `\bbl@inidata` may contain data declared in `\babelprovide`, with ‘slashed’ keys. There are 3 steps: first read the ini file and store it; then traverse the stored values, and process some groups if required (date, captions, labels, counters); finally, ‘export’ some values by defining global macros (identification, typography, characters, numbers). The second argument is 0 when called to read the minimal data for fonts; with `\babelprovide` it’s either 1 (without import) or 2 (which import). The value `-1` is used with `\DocumentMetadata`.

`\bbl@loop@ini` is the reader, line by line (1: stream), and calls `\bbl@iniline` to save the key/value pairs. If `\bbl@inistore` finds the `@include` directive, the input stream is switched temporarily and `\bbl@read@subini` is called.

When the language is being set based on the document metadata (#2 in `\bbl@read@ini` is `-1`), there is an interlude to get the name, after the data have been collected, and before it’s processed.

```

```

A key with a slash in \babelprovide replaces the value in the ini file (which is ignored altogether). The mechanism is simple (but suboptimal): add the data to the ini one (at this point the ini file has not yet been read), and define a dummy macro. When the ini file is read, just skip the corresponding key and reset the macro (in \bbl@inistore above).

```

Key-value pairs are treated differently depending on the section in the ini file. The following macros are the readers for identification and typography. Note `\bbl@ini@exports` is called always (via `\bbl@inisec`), while `\bbl@after@ini` must be called explicitly after `\bbl@read@ini` if necessary.

Although BCP 47 doesn't treat 'x-' as an extension, the CLDR and many other sources do (as a *private use extension*). For consistency with other single-letter subtags or 'singletons', here is considered an extension, too.

The identification section is used internally by babel in the following places [to be completed]: BCP 47 script tag in the Unicode ranges, which is in turn used by `onchar`; the language system is set with the names, and then `fontspec` maps them to the `opentype` tags, but if the latter package doesn't define them, then babel does it; encodings are used in `pdftex` to select a font encoding valid (and preloaded) for a language loaded on the fly.

```

2818 %
2819 \let\bbl@release@transforms\@empty
2820 \let\bbl@release@casing\@empty

```

Relevant keys are 'exported', i.e., global macros with short names are created with values taken from the corresponding keys. The number of exported keys depends on the loading level (#1): -1 and 0 only info (the identification section), 1 also basic (like linebreaking or character ranges), 2 also (re)new (with date and captions).

```

**Dates** will require some macros for the basic formatting. They may be redefined by language, so “semi-public” names (camel case) are used. Oddly enough, the CLDR places particles like “de” inconsistently in either in the date or in the month name. Note after \bbl@replace \toks@ contains the resulting string, which is used by \bbl@replace@finish@iii (this implicit behavior doesn’t seem a good idea, but it’s efficient).

3202   \else
3203     \let\normalsfcodes\bbl@normalsf
3204   \fi}

```

### Transforms.

Process the transforms read from ini files, converts them to a form close to the user interface (with `\babelprehyphenation` and `\babelposthyphenation`), wrapped with `\bbl@transforms@aux` ...`\relax`, and stores them in `\bbl@release@transforms`. However, since building a list enclosed in braces isn't trivial, the replacements are added after a comma, and then `\bbl@transforms@aux` adds the braces.

```

## 4.22. Handle language system

The language system (i.e., Language and Script) to be used when defining a font or setting the direction are set with the following macros. It also deals with unhyphenated line breaking in xetex (e.g., Thai and traditional Sanskrit), which is done with a hack at the font level because this engine doesn't support it.

```

3259 \def\bbl@provide@lsys#1{%
3260 \bbl@ifunset{bbl@lname@#1}%
3261 {\bbl@load@info{#1}}%
3262 }%

3282 \fi
3283 \bbl@csarg\bbl@toglobal{lsys@#1}}

```

## 4.23. Numerals

A tool to define the macros for native digits from the list provided in the ini file. Somewhat convoluted because there are 10 digits, but only 9 arguments in T<sub>E</sub>X. Non-digits characters are kept. The first macro is the generic “localized” command.

```

3284 \def\bbl@setdigits#1#2#3#4#5{%
3285 \bbl@exp{%

```

```

3286 \def\<\language name digits>####1{% i.e., \langdigits

3311 \\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi\\\fi
3312 \\\expandafter\<bbl@digits@\language name>%
3313 \\\fi}}}%
3314 \bbl@tempa}

```

Alphabetic counters must be converted from a space separated list to an \ifcase structure.

```

3315 \def\bbl@buildifcase#1 {% Returns \bbl@tempa, requires \toks@=}{
3316 \ifx\#1% % \ before, in case #1 is multiletter
3317 \bbl@exp{%
3318 \def\\\bbl@tempa####1{%
3319 \<ifcase>####1\space\the\toks@\<else>\\\@ctrerr\<fi>}}%
3320 \else
3321 \toks@\expandafter\the\toks@\or #1}%
3322 \expandafter\bbl@buildifcase
3323 \fi}

```

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collects digits which have been left 'unused' in previous arguments, the first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case, for a fixed form (see babel-he.ini, for example).

## 4.26. BCP 47 related commands

This macro is called by language selectors when the language isn't recognized. So, it's the core for (1) mapping from a BCP 27 tag to the actual language, if `bcp47.toname` is enabled (i.e., if `bbl@bcptoname` is true), and (2) lazy loading. With `autoload.bcp47` enabled *and* lazy loading, we must first build a name for the language, with the help of `autoload.bcp47.prefix`. Then we use `\provideprovide` passing the options set with `autoload.bcp47.options` (by default `import`). Finally, and if the locale has not been loaded before, we use `\provideprovide` with the language name as passed to the selector.

```

$\TeX$  needs to know the BCP 47 codes for some features. For that, it expects `\BCPdata` to be defined. While language, region, script, and variant are recognized, extension.`<s>` for singletons may change.

Still somewhat hackish. Note `\str_if_eq:nnTF` is fully expandable (`\bbl@ifsamestring` isn't). The argument is the prefix to `tag.bcp47`.

```

## 5.1. Cross referencing macros

The  $\LaTeX$  book states:

The key argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The following package options control which macros are to be redefined.

```

3631 << *More package options >> ≡
3632 \DeclareOption{safe=none}{\let\bbl@opt@safe\@empty}
3633 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
3634 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
3635 \DeclareOption{safe=refbib}{\def\bbl@opt@safe{BR}}
3636 \DeclareOption{safe=bibref}{\def\bbl@opt@safe{BR}}
3637 <</More package options >>

```

**\@newl@bel** First we open a new group to keep the changed setting of `\protect` local and then we set the `@safe@actives` switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```

3638 \bbl@trace{Cross referencing macros}
3639 \ifx\bbl@opt@safe\@empty\else % i.e., if 'ref' and/or 'bib'
3640     \def\@newl@bel#1#2#3{%
3641         {\@safe@activetrue
3642         \bbl@ifunset{#1@#2}%
3643             \relax
3644             {\gdef\@multiplelabels{%
3645                 \latex@warning@no@line{There were multiply-defined labels}}}%
3646                 \latex@warning@no@line{Label `#2' multiply defined}}}%
3647     \global\@namedef{#1@#2}{#3}}

```

**\@testdef** An internal  $\LaTeX$  macro used to test if the labels that have been written on the aux file have changed. It is called by the `\enddocument` macro.

```

3648 \CheckCommand*\@testdef[3]{%
3649     \def\reserved@a{#3}%
3650     \expandafter\ifx\csname#1@#2\endcsname\reserved@a
3651     \else
3652         \@tempwattrue
3653     \fi}

```

Now that we made sure that `\@testdef` still has the same definition we can rewrite it. First we make the shorthands ‘safe’. Then we use `\bbl@tempa` as an ‘alias’ for the macro that contains the label which is being checked. Then we define `\bbl@tempb` just as `\@newl@bel` does it. When the label

is defined we replace the definition of `\bbl@tempa` by its meaning. If the label didn't change, `\bbl@tempa` and `\bbl@tempb` should be identical macros.

```

3654 \def\@testdef#1#2#3{%
3655   \@safe@activetrue
3656   \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname
3657   \def\bbl@tempb{#3}%
3658   \@safe@activetrue
3659   \ifx\bbl@tempa\relax
3660   \else
3661     \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
3662   \fi
3663   \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
3664   \ifx\bbl@tempa\bbl@tempb
3665   \else
3666     \@tempwattrue
3667   \fi}
3668 \fi

```

## **\ref**

**\pageref** The same holds for the macro `\ref` that references a label and `\pageref` to reference a page. We make them robust as well (if they weren't already) to prevent problems if they should become expanded at the wrong moment.

```

3669 \bbl@xin@{R}\bbl@opt@safe
3670 \ifin@
3671   \edef\bbl@tempc{\expandafter\string\csname ref code\endcsname}%
3672   \bbl@xin@{\expandafter\strip@prefix\meaning\bbl@tempc}%
3673   {\expandafter\strip@prefix\meaning\ref}%
3674 \ifin@
3675   \bbl@redefine\@kernel@ref#1{%
3676     \@safe@activetrue\org@@kernel@ref{#1}\@safe@activetrue}
3677   \bbl@redefine\@kernel@pageref#1{%
3678     \@safe@activetrue\org@@kernel@pageref{#1}\@safe@activetrue}
3679   \bbl@redefine\@kernel@sref#1{%
3680     \@safe@activetrue\org@@kernel@sref{#1}\@safe@activetrue}
3681   \bbl@redefine\@kernel@spageref#1{%
3682     \@safe@activetrue\org@@kernel@spageref{#1}\@safe@activetrue}
3683   \else
3684     \bbl@redefineroobust\ref#1{%
3685       \@safe@activetrue\org@ref{#1}\@safe@activetrue}
3686     \bbl@redefineroobust\pageref#1{%
3687       \@safe@activetrue\org@pageref{#1}\@safe@activetrue}
3688   \fi
3689 \else
3690   \let\org@ref\ref
3691   \let\org@pageref\pageref
3692 \fi

```

**\@citex** The macro used to cite from a bibliography, `\cite`, uses an internal macro, `\@citex`. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave `\cite` alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```

3693 \bbl@xin@{B}\bbl@opt@safe
3694 \ifin@
3695   \bbl@redefine\@citex[#1]#2{%
3696     \@safe@activetrue\edef\bbl@tempa{#2}\@safe@activetrue
3697     \org@@citex{#1}{\bbl@tempa}}

```

Unfortunately, the packages `natbib` and `cite` need a different definition of `\@citex`... To begin with, `natbib` has a definition for `\@citex` with *three* arguments... We only know that a package is loaded when `\begin{document}` is executed, so we need to postpone the different redefinition.

Notice that we use `\def` here instead of `\bbl@redefine` because `\org@citex` is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of `natbib` change dynamically `\@citex`, so PR4087 doesn't seem fixable in a simple way. Just load `natbib` before.)

```
3698 \AtBeginDocument{%
3699   \@ifpackageloaded{natbib}{%
3700     \def\@citex[#1][#2]#3{%
3701       \@safe@activestrue\edef\bbl@tempa{#3}\@safe@activesfalse
3702       \org@citex[#1][#2]{\bbl@tempa}}%
3703     }{}}
```

The package `cite` has a definition of `\@citex` where the shorthands need to be turned off in both arguments.

```
3704 \AtBeginDocument{%
3705   \@ifpackageloaded{cite}{%
3706     \def\@citex[#1]#2{%
3707       \@safe@activestrue\org@citex[#1]{#2}\@safe@activesfalse}%
3708     }{}}
```

**\nocite** The macro `\nocite` which is used to instruct  $\text{\LaTeX}$  to extract uncited references from the database.

```
3709 \bbl@redefine\nocite#1{%
3710   \@safe@activestrue\org@nocite{#1}\@safe@activesfalse}
```

**\bibcite** The macro that is used in the aux file to define citation labels. When packages such as `natbib` or `cite` are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where `\@safe@activestrue` is in effect. This switch needs to be reset inside the `\hbox` which contains the citation label. In order to determine during aux file processing which definition of `\bibcite` is needed we define `\bibcite` in such a way that it redefines itself with the proper definition. We call `\bbl@cite@choice` to select the proper definition for `\bibcite`. This new definition is then activated.

```
3711 \bbl@redefine\bibcite{%
3712   \bbl@cite@choice
3713   \bibcite}
```

**\bbl@bibcite** The macro `\bbl@bibcite` holds the definition of `\bibcite` needed when neither `natbib` nor `cite` is loaded.

```
3714 \def\bbl@bibcite#1#2{%
3715   \org@bibcite{#1}{\@safe@activesfalse#2}}
```

**\bbl@cite@choice** The macro `\bbl@cite@choice` determines which definition of `\bibcite` is needed. First we give `\bibcite` its default definition.

```
3716 \def\bbl@cite@choice{%
3717   \global\let\bibcite\bbl@bibcite
3718   \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}}%
3719   \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}}%
3720   \global\let\bbl@cite@choice\relax}
```

When a document is run for the first time, no aux file is available, and `\bibcite` will not yet be properly defined. In this case, this has to happen before the document starts.

```
3721 \AtBeginDocument{\bbl@cite@choice}
```

**\@bibitem** One of the two internal  $\text{\LaTeX}$  macros called by `\bibitem` that write the citation label on the aux file.

```
3722 \bbl@redefine\@bibitem#1{%
3723   \@safe@activestrue\org@bibitem{#1}\@safe@activesfalse}
3724 \else
3725   \let\org@nocite\nocite
3726   \let\org@citex\@citex
```

```

3727 \let\org@bibtex\org@bibtex
3728 \let\org@bibitem\org@bibitem
3729 \fi

```

### 5.3. Marks

**\markright** Because the output routine is asynchronous, we must pass the current language attribute to the head lines. To achieve this we need to adapt the definition of `\markright` and `\markboth` somewhat. However, headlines and footlines can contain text outside marks; for that we must take some actions in the output routine if the 'headfoot' options is used.

We need to make some redefinitions to the output routine to avoid an endless loop and to correctly handle the page number in bidi documents.

```

3813 \bbl@trace{Marks}
3814 \IfBabelLayout{sectioning}
3815 {\ifx\bbl@opt@headfoot\@nnil

3833 {\protect\bbl@restore@actives\the\toks@}}}%

```

**\markboth**

**\@mkboth** The definition of `\markboth` is equivalent to that of `\markright`, except that we need two token registers. The documentclasses report and book define and set the headings for the page.

While doing so they also store a copy of `\markboth` in `\@mkboth`. Therefore we need to check whether `\@mkboth` has already been set. If so we need to do that again with the new definition of `\markboth`. (As of Oct 2019,  $\TeX$  stores the definition in an intermediate macro, so it's not necessary anymore, but it's preserved for older versions.)

```

3852 \fi} % end ifbbl@single, end \IfBabelLayout

```

## 5.4. Other packages

### 5.4.1. `ifthen`

**`\ifthenelse`** Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

% \ifthenelse{\isodd{\pageref{some-label}}}
% {code for odd pages}
% {code for even pages}
%

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work.

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments.

```

3853 \bbl@trace{Preventing clashes with other packages}
3854 \ifx\org@ref\undefined\else
3855 \bbl@xin@{R}\bbl@opt@safe
3856 \ifin@
3857 \AtBeginDocument{%
3858 \@ifpackageloaded{ifthen}{%
3859 \bbl@redefine@long\ifthenelse#1#2#3{%
3860 \let\bbl@temp@pref\pageref

3862 \let\bbl@temp@ref\ref
3863 \let\ref\org@ref
3864 \@safe@activestrue
3865 \org@ifthenelse{#1}%
3866 {\let\pageref\bbl@temp@pref
3867 \let\ref\bbl@temp@ref
3868 \@safe@activesfalse
3869 #2}%
3870 {\let\pageref\bbl@temp@pref

```

```

3871         \let\ref\bbl@temp@ref
3872         \@safe@activesfalse
3873         #3}%
3874     }%
3875 }{}%
3876 }
3877 \fi

```

### 5.4.2. varioref

**\@@vpageref**

**\vrefpagenum**

**\Ref** When the package `varioref` is in use we need to modify its internal command `\@@vpageref` in order to prevent problems when an active character ends up in the argument of `\vref`. The same needs to happen for `\vrefpagenum`.

```

3878 \AtBeginDocument{%
3879   \@ifpackageloaded{varioref}{%
3880     \bbl@redefine\@@vpageref#1[#2]#3{%
3881       \@safe@activestrue
3882       \org@@vpageref{#1}[#2]#3}%
3883     \@safe@activesfalse}%
3884   \bbl@redefine\vrefpagenum#1#2{%
3885     \@safe@activestrue
3886     \org@vrefpagenum{#1}#2}%
3887   \@safe@activesfalse}%

```

The package `varioref` defines `\Ref` to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of `\ref`. So we employ a little trick here. We redefine the (internal) command `\Ref_` to call `\org@ref` instead of `\ref`. The disadvantage of this solution is that whenever the definition of `\Ref` changes, this definition needs to be updated as well.

```

3888   \expandafter\def\csname Ref \endcsname#1{%
3889     \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
3890   }{}%
3891 }
3892 \fi

```

### 5.4.3. hhline

**\hhline** Delaying the activation of the shorthand characters has introduced a problem with the `hhline` package. The reason is that it uses the ‘:’ character which is made active by the french support in `babel`. Therefore we need to *reload* the package when the ‘:’ is an active character. Note that this happens *after* the category code of the @-sign has been changed to other, so we need to temporarily change it to letter again.

```

3893 \AtEndOfPackage{%
3894   \AtBeginDocument{%
3895     \@ifpackageloaded{hhline}%
3896     {\expandafter\ifx\csname normal@char\string\endcsname\relax
3897       \else
3898         \makeatletter
3899         \def\@currname{hhline}\input{hhline.sty}\makeatother
3900       \fi}%
3901     {}}}

```

**\substitutefontfamily** *Deprecated.* It creates an `fd` file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names. Use the tools provided by `TeX` (`\DeclareFontFamilySubstitution`).

```

3902 \def\substitutefontfamily#1#2#3{%
3903   \lowercase{\immediate\openout15=#1#2.fd\relax}%
3904   \immediate\write15{%
3905     \string\ProvidesFile{#1#2.fd}%
3906     [\the\year/\two@digits{\the\month}/\two@digits{\the\day}}

```

```

3919 }
3920 \@onlypreamble\substitutefontfamily

```

## 5.5. Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of  $\text{\TeX}$  and  $\text{\LaTeX}$  always come out in the right encoding. There is a list of non-ASCII encodings. Requested encodings are currently stored in `\@fontenc@load@list`. If a non-ASCII has been loaded, we define versions of `\TeX` and `\LaTeX` for them using `\ensureascii`. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

### `\ensureascii`

```

3921 \bbl@trace{Encoding and fonts}
3922 \newcommand\BabelNonASCII{LGR,LGI,X2,OT2,OT3,OT6,LHE,LWN,LMA,LMC,LMS,LMU}
3923 \newcommand\BabelNonText{TS1,T3,TS3}
3924 \let\org@TeX\TeX
3925 \let\org@LaTeX\LaTeX
3926 \let\ensureascii\@firstofone
3927 \let\asciiencoding\@empty
3928 \AtBeginDocument{%
3929   \def\elt#1{,#1,}%
3930   \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3931   \let\elt\relax
3932   \let\bbl@tempb\@empty
3933   \def\bbl@tempc{OT1}%
3934   \bbl@foreach\BabelNonASCII{% LGR loaded in a non-standard way
3935     \bbl@ifunset{T@#1}{\def\bbl@tempb{#1}}}%
3936   \bbl@foreach\bbl@tempa{%
3937     \bbl@xin@{,#1,}{,\BabelNonASCII,}%
3938     \ifin@
3939       \def\bbl@tempb{#1}% Store last non-ascii
3940     \else\bbl@xin@{,#1,}{,\BabelNonText,}% Pass
3941       \ifin@else
3942         \def\bbl@tempc{#1}% Store last ascii
3943       \fi
3944     \fi}%
3945   \ifx\bbl@tempb\@empty\else
3946     \bbl@xin@{,\cf@encoding,}{,\BabelNonASCII,\BabelNonText,}%
3947     \ifin@else
3948       \edef\bbl@tempc{\cf@encoding}% The default if ascii wins
3949     \fi
3950   \let\asciiencoding\bbl@tempc
3951   \renewcommand\ensureascii[1]{%
3952     {\fontencoding{\asciiencoding}\selectfont#1}}%
3953   \DeclareTextCommandDefault{\TeX}{\ensureascii{\org@TeX}}%
3954   \DeclareTextCommandDefault{\LaTeX}{\ensureascii{\org@LaTeX}}%
3955   \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at `\begin{document}`, which latin fontencoding to use.

**\latinencoding** When text is being typeset in an encoding other than ‘latin’ (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```
3956 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}
```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of `\begin{document}` whether it was loaded with the T1 option. The normal way to do this (using `\ifpackageloaded`) is disabled for this package. Now we have to revert to parsing the internal macro `\@filelist` which contains all the filenames loaded.

```
3957 \AtBeginDocument{%
3958   \@ifpackageloaded{fontspec}%
3959   {\xdef\latinencoding{%
3960     \ifx\UTFencname\@undefined
3961       EU\ifcase\bbl@engine\or2\or1\fi
3962     \else
3963       \UTFencname
3964     \fi}}%
3965   {\gdef\latinencoding{OT1}%
3966     \ifx\cf@encoding\bbl@t@one
3967       \xdef\latinencoding{\bbl@t@one}%
3968     \else
3969       \def\@elt#1{,#1,}%
3970       \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
3971       \let\@elt\relax
3972       \bbl@xin@{,T1,}\bbl@tempa
3973       \ifin@
3974         \xdef\latinencoding{\bbl@t@one}%
3975       \fi
3976     \fi}}
```

**\latintext** Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```
3977 \DeclareRobustCommand{\latintext}{%
3978   \fontencoding{\latinencoding}\selectfont
3979   \def\encodingdefault{\latinencoding}}
```

**\textlatin** This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```
3980 \ifx\@undefined\DeclareTextFontCommand
3981   \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
3982 \else
3983   \DeclareTextFontCommand{\textlatin}{\latintext}
3984 \fi
```

For several functions, we need to execute some code with `\selectfont`. With  $\TeX$  2021-06-01, there is a hook for this purpose.

```
3985 \def\bbl@patchfont#1{\AddToHook{selectfont}{#1}}
```

## 5.6. Basic bidi support

This code is currently placed here for practical reasons. It will be moved to the correct place soon, I hope.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This babel module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I’ve also looked at ARABI (by Youssef Jabri), which is compatible with babel.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- pdfTeX provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- xetex is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour T<sub>E</sub>X grouping.
- luatex can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As LuaT<sub>E</sub>X-jā shows, vertical typesetting is possible, too.

```

3986 \bbl@trace{Loading basic (internal) bidi support}

## 5.7. Local Language Configuration

**\loadlocalcfg** At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension .cfg. For instance the file norsk.cfg will be loaded when the language definition file norsk.ldf is loaded.

For plain-based formats we don't want to override the definition of \loadlocalcfg from plain.def.

```

4157 \bbl@trace{Local Language Configuration}
4158 \ifx\loadlocalcfg\undefined
4159 \ifpackagewith{babel}{noconfigs}%
4160 {\let\loadlocalcfg@gobble}%
4161 {\def\loadlocalcfg#1{%
4162 \InputIfFileExists{#1.cfg}%
4163 {\typeout{*****^J%
4164 * Local config file #1.cfg used^J%
4165 *}}%
4166 \@empty}}
4167 \fi

```

## 5.8. Language options

Languages are loaded when processing the corresponding option *except* if a main language has been set. In such a case, it is not loaded until all options has been processed. The following macro inputs the ldf file and does some additional checks (\input works, too, but possible errors are not caught).

```

4168 \bbl@trace{Language options}
4169 \def\BabelDefinitionFile#1#2#3{}
4170 \let\bbl@afterlang\relax
4171 \let\BabelModifiers\relax
4172 \let\bbl@loaded\@empty
4173 \def\bbl@load@language#1{%
4174 \InputIfFileExists{#1.ldf}%
4175 {\edef\bbl@loaded{\CurrentOption
4176 \ifx\bbl@loaded\@empty\else,\bbl@loaded\fi}%
4177 \expandafter\let\expandafter\bbl@afterlang
4178 \csname\CurrentOption.ldf-h@k\endcsname
4179 \expandafter\let\expandafter\BabelModifiers
4180 \csname bbl@mod@\CurrentOption\endcsname
4181 \bbl@exp{\AtBeginDocument{%
4182 \bbl@usehooks@lang{\CurrentOption}{\begin{document}}{\CurrentOption}}}%
4183 {\bbl@error{unknown-package-option}}}}

```

Another way to extend the list of 'known' options for babel was to create the file bblopts.cfg in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new ldf file loading the actual one. You can also set the name of the file with the package option config=<name>, which will load <name>.cfg instead.

If the language has been set as metadata, read the info from the corresponding ini file and extract the babel name. Then added it as a package option at the end, so that it becomes the main language. The behavior of a metatag with a global language option is not well defined, so if there is not a main option we set here explicitly.

Tagging PDF Span elements requires horizontal mode. With DocumentMetadata we also force it with \foreignlanguage (this is also done in bidi texts).

```

4184 \ifx\GetDocumentProperties\undefined\else
4185 \let\bbl@beforeforeign\leavevmode

4219 \fi

```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `\bbl@language@opts` are assumed to be languages. If not declared above, the names of the option and the file are the same. We first pre-process the class and package options to determine the main language, which is processed in the third ‘main’ pass, *except* if all files are `\ldf` and there is no main key. In the latter case (`\bbl@opt@main` is still `\@nnil`), the traditional way to set the main language is kept — the last loaded is the main language.

For efficiency, first preprocess the class options to remove those with `=`, which are becoming increasingly frequent (no language should contain this character).

## 6. The kernel of Babel

The kernel of the babel system is currently stored in `babel.def`. The file `babel.def` contains most of the code. The file `hyphen.cfg` is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns.

Because plain  $\TeX$  users might want to use some of the features of the babel system too, care has to be taken that plain  $\TeX$  can process the files. For this reason the current format will have to be

checked in a number of places. Some of the code below is common to plain  $\TeX$  and  $\LaTeX$ , some of it is for the  $\LaTeX$  case only.

Plain formats based on `etex` (`etex`, `xetex`, `luatex`) don't load `hyphen.cfg` but `etex.src`, which follows a different naming convention, so we need to define the `babel` names. It presumes `language.def` exists and it is the same file used when formats were created.

A proxy file for `switch.def`

```
4358 < *kernel
4359 \let\bbl@onlyswitch\@empty
4360 \input babel.def
4361 \let\bbl@onlyswitch\@undefined
4362 < /kernel
```

## 7. Error messages

They are loaded when `\bbl@error` is first called. To save space, the main code just identifies them with a tag, and messages are stored in a separate file. Since it can be loaded anywhere, you make sure some catcodes have the right value, although those for `\`, ```, `^`, `M`, `%` and `=` are reset before loading the file.

```
4363 < *errors
4364 \catcode`\{=1 \catcode`\}=2 \catcode`\#=6
4365 \catcode`\:=12 \catcode`\.,=12 \catcode`\.=12 \catcode`\-=12

## 8. Loading hyphenation patterns

The following code is meant to be read by `iniTeX` because it should instruct `TeX` to read hyphenation patterns. To this end the `docstrip` option `patterns` is used to include this code in the file `hyphen.cfg`. Code is written with lower level macros.

```

4575 <@Make sure ProvidesFile is defined@>
4576 \ProvidesFile{hyphen.cfg}[<@date@> v<@version@> Babel hyphens]
4577 \xdef\bbl@format{\jobname}
4578 \def\bbl@version{<@version@>}
4579 \def\bbl@date{<@date@>}
4580 \ifx\AtBeginDocument\@undefined
4581   \def\@empty{}
4582 \fi
4583 <@Define core switching macros@>

```

**\process@line** Each line in the file `language.dat` is processed by `\process@line` after it is read. The first thing this macro does is to check whether the line starts with `=`. When the first token of a line is

an =, the macro `\process@synonym` is called; otherwise the macro `\process@language` will continue.

```

4584 \def\process@line#1#2 #3 #4 {%
4585   \ifx=#1%
4586     \process@synonym{#2}%
4587   \else
4588     \process@language{#1#2}{#3}{#4}%
4589   \fi
4590   \ignorespaces}

```

**\process@synonym** This macro takes care of the lines which start with an =. It needs an empty token register to begin with. `\bbl@languages` is also set to empty.

```

4591 \toks@{}
4592 \def\bbl@languages{}

```

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The `\relax` just helps to the `\if` below catching synonyms without a language.)

Otherwise the name will be a synonym for the language loaded last.

We also need to copy the `hyphenmin` parameters for the synonym.

```

4593 \def\process@synonym#1{%
4594   \ifnum\last@language=\m@ne
4595     \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
4596   \else
4597     \expandafter\chardef\csname l@#1\endcsname\last@language
4598     \wlog{\string\l@#1=\string\language\the\last@language}%
4599     \expandafter\let\csname #1hyphenmins\endcsname
4600       \csname\language\hyphenmins\endcsname
4601     \let\bbl@elt\relax
4602     \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}}}%
4603   \fi}

```

**\process@language** The macro `\process@language` is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions.

The first thing to do is call `\addlanguage` to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file `language.dat` by adding for instance ‘:T1’ to the name of the language. The macro `\bbl@get@enc` extracts the font encoding from the language name and stores it in `\bbl@hyph@enc`. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to `\lefthyphenmin` and `\righthyphenmin`.  $\TeX$  does not keep track of these assignments. Therefore we try to detect such assignments and store them in the `\<language>hyphenmins` macro. When no assignments were made we provide a default setting.

Some pattern files contain changes to the `\lccode` `\uccode` arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the `\patterns` command acts globally so its effect will be remembered.

Then we globally store the settings of `\lefthyphenmin` and `\righthyphenmin` and close the group.

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

`\bbl@languages` saves a snapshot of the loaded languages in the form `\bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}`. Note the last 2 arguments are empty in ‘dialects’ defined in `language.dat` with =. Note also the language name can have encoding info.

Finally, if the counter `\language` is equal to zero we execute the synonyms stored.

```

4604 \def\process@language#1#2#3{%
4605   \expandafter\addlanguage\csname l@#1\endcsname
4606   \expandafter\language\csname l@#1\endcsname

```

```

4607 \edef\languagename{#1}%
4608 \bbl@hook@everylanguage{#1}%
4609 % > luatex

4631 \set@hyphenmins\tw@\thr@@\relax
4632 \else
4633 \expandafter\expandafter\expandafter\set@hyphenmins
4634 \csname #1hyphenmins\endcsname
4635 \fi
4636 \the\toks@
4637 \toks@{}%
4638 \fi}

```

### **\bbl@get@enc**

**\bbl@hyph@enc** The macro \bbl@get@enc extracts the font encoding from the language name and stores it in \bbl@hyph@enc. It uses delimited arguments to achieve this.

```

4639 \def\bbl@get@enc#1:#2:#3\@@@{\def\bbl@hyph@enc{#2}}

```

Now, hooks are defined. For efficiency reasons, they are dealt here in a special way. Besides luatex, format-specific configuration files are taken into account. loadkernel currently loads nothing, but define some basic macros instead.

```

4710   \input hyphen.tex\relax
4711   \chardef\l@english\z@
4712 \else

```

Pattern registers are allocated using count register `\last@language`. Its initial value is 0. The definition of the macro `\newlanguage` is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize `\last@language` with the value `-1`.

```

4713 \last@language@m@ne

```

We now read lines from the file until the end is found. While reading from the input, it is useful to switch off recognition of the end-of-line character. This saves us stripping off spaces from the contents of the control sequence.

```
4714 \loop
4715 \endlinechar\m@ne
4716 \readl to \bbl@line
4717 \endlinechar\^M
```

If the file has reached its end, exit from the loop here. If not, empty lines are skipped. Add 3 space characters to the end of \bbl@line. This is needed to be able to recognize the arguments of \process@line later on. The default language should be the very first one.

```
4718 \if T\ifeof1F\fi T\relax
4719 \ifx\bbl@line\empty\else
4720 \edef\bbl@line{\bbl@line\space\space\space}%
4721 \expandafter\process@line\bbl@line\relax
4722 \fi
4723 \repeat
```

Check for the end of the file. We must reverse the test for \ifeof without \else. Then reactivate the default patterns, and close the configuration file.

```
4724 \begingroup
4725 \def\bbl@elt#1#2#3#4{%

Now the macros defining the font with fontspec.

When there are repeated keys in fontspec, the last value wins. So, we just place the ini settings at the beginning, and user settings will take precedence. We must deactivate temporarily `\bbl@mapselect` because `\selectfont` is called internally when a font is defined.

For historical reasons,  $\text{\LaTeX}$  can select two different series (bx and b), for what is conceptually a single one. This can lead to problems when a single family requires several fonts, depending on the language, mainly because ‘substitutions’ with some combinations are not done consistently – sometimes bx/sc is the correct font, but sometimes points to b/n, even if b/sc exists. So, some substitutions are redefined (in a somewhat hackish way, by inspecting if the variant declaration contains `>ssub*`).

```

4870 \def\bbl@font@set#1#2#3{% e.g., \bbl@rmdflt@lang \rmdefault \rmfamily

4881   {}%

```

Loaded locally, which does its job, but very must be global. The problem is how. This actually defines a font predeclared with `\babelfont`, making sure Script and Language names are defined. If they are not, the corresponding data in the ini file is used. The font is actually set temporarily to get the family name (`\f@family`). There is also a hack because by default some replacements related to the bold series are sometimes assigned to the wrong font (see issue #92).

```

## 10.2. Support for interchar

xetex reserves some values for CJK (although they are not set in XELATEX), so we make sure they are skipped. Define some user names for the global classes, too.

```

5006 \ifnum\xe@alloc@intercharclass<\thr@@
5007 \xe@alloc@intercharclass\thr@@
5008 \fi
5009 \chardef\bbbl@xe@class@default@=\z@
5010 \chardef\bbbl@xe@class@cjkideogram@=\@ne
5011 \chardef\bbbl@xe@class@cjkleftpunctuation@=\tw@
5012 \chardef\bbbl@xe@class@cjkrightpunctuation@=\thr@@
5013 \chardef\bbbl@xe@class@boundary@=4095
5014 \chardef\bbbl@xe@class@ignore@=4096

```

The machinery is activated with a hook (enabled only if actually used). Here \bbbl@tempc is pre-set with \bbbl@usingxe@class, defined below. The standard mechanism based on \originalTeX to save,

set and restore values is used. \count@ stores the previous char to be set, except at the beginning (0) and after \bbl@upto, which is the previous char negated, as a flag to mark a range.

```

5015 \AddBabelHook{babel-interchar}{beforeextras}{%
5016   \@nameuse{bbl@xechars@\language\name}}
5017 \DisableBabelHook{babel-interchar}
5018 \protected\def\bbl@charclass#1{%
5019   \ifnum\count@<\z@
5020     \count@-\count@
5021     \loop
5022       \bbl@exp{%
5023         \\babel@savevariable{\XeTeXcharclass`\Uchar\count@}}%
5024         \XeTeXcharclass\count@ \bbl@tempc
5025         \ifnum\count@<`#1\relax
5026           \advance\count@\@ne
5027         \repeat

5029     \babel@savevariable{\XeTeXcharclass`#1}%
5030     \XeTeXcharclass`#1 \bbl@tempc
5031   \fi
5032   \count@`#1\relax}

```

Now the two user macros. Char classes are declared implicitly, and then the macro to be executed at the babel-interchar hook is created. The list of chars to be handled by the hook defined above has internally the form \bbl@usingxechar\bbl@xechar@punct@english\bbl@charclass{.} \bbl@charclass{,} (etc.), where \bbl@usingxechar stores the class to be applied to the subsequent characters. The \ifcat part deals with the alternative way to enter characters as macros (e.g., \). As a special case, hyphens are stored as \bbl@upto, to deal with ranges.

```

5033 \newcommand\bbl@ifinterchar[1]{%
5034   \let\bbl@tempa\@gobble % Assume to ignore

## 10.3. Layout

Note elements like headlines and margins can be modified easily with packages like fancyhdr, typearea or titles, and geometry.

\bbl@startskip and \bbl@endskip are available to package authors. Thanks to the T<sub>E</sub>X expansion mechanism the following constructs are valid: \adim\bbl@startskip, \advance\bbl@startskip\adim, \bbl@startskip\adim.

Consider txtbabel as a shorthand for *tex-xet babel*, which is the bidi model in both pdftex and xetex.

```

5113 < *xetex | texxet>

## 10.5. LuaTeX

The loader for luatex is based solely on `language.dat`, which is read on the fly. The code shouldn't be executed when the format is build, so we check if `\AddBabelHook` is defined. Then comes a modified version of the loader in `hyphen.cfg` (without the `hyphenmins` stuff, which is under the direct control of babel).

The names `\l@<language>` are defined and take some value from the beginning because all `ldf` files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means when the `ldf` finishes). If a language has been loaded, `\bbl@hyphendata@<num>` exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for 'english', so that it's available without further intervention from the user. To avoid duplicating it, the following rule applies: if the "0th" language and the first language in `language.dat` have the same name then just ignore the latter. If there are new synonymous, they are added, but note if the language patterns have not been preloaded they won't at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn't happen very often – with luatex patterns are best loaded when the document is typeset, and the "0th" language is preloaded just for backwards compatibility.

As of 1.1b, lua(e)tex is taken into account. Formerly, loading of patterns on the fly didn't work in this format, but with the new loader it does. Unfortunately, the format is not based on babel, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format `language.dat` is used (under the principle of a single source), instead of `language.def`.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by babel) provide a command to allocate them (although there are packages like `ctablestack`). FIX - This isn't true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To complicate things, `etex.sty` changes the way languages are allocated.

This files is read at three places: (1) when `plain.def`, `babel.sty` starts, to read the list of available languages from `language.dat` (for the base option); (2) at `hyphen.cfg`, to modify some macros; (3) in the middle of `plain.def` and `babel.sty`, by `babel.def`, with the commands and other definitions for luatex (e.g., `\babelpatterns`).

## 10.6. Southeast Asian scripts

First, some general code for line breaking, used by `\babelposthyphenation`.

Replace regular (i.e., implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched. See Unicode UAX 14.

## 10.7. CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

```

5694 \catcode`\%=14

## 10.9. Common stuff

First, a couple of auxiliary macros to set the renderer according to the script. This is done by patching temporarily the low-level fontspec macro containing the current features set with `\defaultfontfeatures`. Admittedly this is somewhat dangerous, but that way the latter command still works as expected, because the renderer is set just before other settings. In xetex they are set to `\relax`.

```

```

## 10.10. Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a the function `Babel.locale_map`, which just traverse the node list to carry out the

replacements. The table `loc_to_scr` stores the script range for each locale (whose id is the key), copied from this table (so that it can be modified on a locale basis); there is an intermediate table named `chr_to_loc` built on the fly for optimization, which maps a char to the locale. This locale is then used to get the `\language` as stored in `locale_props`, as well as the font (as requested). In the latter table a key starting with `/` maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

```

```

Post-handling hyphenation patterns for non-standard rules, like `ff` to `ff-f`. There are still some issues with speed (not very slow, but still slow). The Lua code is below.

```

6265 \directlua{% DL7
6266   Babel.nohyphenation = \the\l@nohyphenation
6267 }

```

Now the  $\TeX$  high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the `{n}` syntax. For example, `pre={1}{1}-`

becomes `function(m) return m[1]..m[1]..'-' end`, where `m` are the matches returned after applying the pattern. With a mapped capture the functions are similar to `function(m) return Babel.capt_map(m[1],1) end`, where the last argument identifies the mapping to be applied to `m[1]`. The way it is carried out is somewhat tricky, but the effect is not dissimilar to `lua load` – save the code as string in a TeX macro, and expand this macro at the appropriate place. As `\directlua` does not take into account the current catcode of `@`, we just avoid this character in macro names (which explains the internal group, too).

```

6268 \begingroup
6269 \catcode`\~ = 12

6462 \directlua{
6463   require('babel-transforms.lua')
6464   Babel.linebreaking.add_before(Babel.pre_hyphenate_replace)
6465 }}
6466 \newcommand\SetTransformValue[3]{%
6467 \directlua{
6468   Babel.locale_props[\the\csname bbl@id@@#1\endcsname].vars["#2"] = #3
6469 }}

```

The code in `babel-transforms.lua` prints at some points the current string being transformed. This macro first make sure this file is loaded. Then, activates temporarily this feature and typeset inside a box the text in the argument.

```

6470 \newcommand\ShowBabelTransforms[1]{%
6471 \bbl@activateprehyphen
6472 \bbl@activateposthyphen
6473 \begingroup
6474 \directlua{ Babel.show_transforms = true }%
6475 \setbox\z@\vbox{#1}%
6476 \directlua{ Babel.show_transforms = false }%
6477 \endgroup}

```

The following experimental (and unfinished) macro applies the prehyphenation transforms for the current locale to a string (characters and spaces) and processes it in a fully expandable way (among other limitations, the string can't contain `]==]`). The way it operates is admittedly rather cumbersome: it converts the string to a node list, processes it, and converts it back to a string. The lua code is in the lua file below.

```

6478 \newcommand\localeprehyphenation[1]{%
6479 \directlua{ Babel.string_prehyphenation([==#1==], \the\localeid) }}

```

## 10.11.Bidi

As a first step, add a handler for bidi and digits (and potentially other processes) just before `luaotfload` is applied, which is loaded by default by  $\text{\LaTeX}$ . Just in case, consider the possibility it has not been loaded.

```

6480 \def\bbl@activate@preotf{%

6514 }}

```

The basic setup. The output is modified at a very low level to set the `\bodydir` to the `\pagedir`. Sadly, we have to deal with boxes in math with basic, so the `\bbl@mathboxdir` hack is activated every math with the package option `bidi=`. The hack for the PUA is no longer necessary with basic (24.8), but it's kept in `basic-r`.

## 10.12 Layout

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with `bidi=basic`, without having to patch almost any macro where text direction is relevant.

Still, there are three areas deserving special attention, namely, tabular, math, and graphics, text and intrinsically left-to-right elements are intermingled. I’ve made some progress in graphics, but they’re essentially hacks; I’ve also made some progress in ‘tabular’, but when I decided to tackle math (both standard math and ‘amsmath’) the nightmare began. I’m still not sure how ‘amsmath’ should be modified, but the main problem is that, boxes are “generic” containers that can hold text, math, and graphics (even at the same time; remember that inline math is included in the list of text nodes marked with ‘math’ (11) nodes too).

`\hangfrom` is useful in many contexts and it is redefined always with the layout option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by `\bodydir`), and when `\parbox` and `\hangindent` are involved. Fortunately, latest releases of luatex simplify a lot the solution with `\shapemode`.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, `tabular` seems to work (at least in simple cases) with `array`, `tabularx`, `hhline`, `colortbl`, `longtable`, `booktabs`, etc. However, `dcolumn` still fails.

```

```

OMEGA provided a companion to `\mathdir` (`\nextfake`) for those cases where we did not want it to be applied, so that the writing direction of the main text was left unchanged. `\bbl@nextfake` is an attempt to emulate it, because `luatex` has removed it without an alternative. Used in `tabular`, `\underline` and `\LaTeX`. Also, `\hangindent` does not honour direction changes by default, so we need to redefine `\@hangfrom`.

## 10.13 Lua: transforms

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at base as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionary, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck).

`post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

## 10.14 Lua: Auto bidi with basic and basic-r

The file `babel-data-bidi.lua` currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```

% [0x25]={d='et'},
% [0x26]={d='on'},
% [0x27]={d='on'},
% [0x28]={d='on', m=0x29},
% [0x29]={d='on', m=0x28},
% [0x2A]={d='on'},
% [0x2B]={d='es'},
% [0x2C]={d='cs'},
%

```

For the meaning of these codes, see the Unicode standard.

Now the `basic-r` bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs `bidi.c` (which also attempts to implement the bidi algorithm with a single loop):

Arrrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them.

In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In babel the dir is set by a higher protocol based on the language/script, which in turn sets the correct dir (<l>, <r> or <al>).

From UAX#9: “Where available, markup should be used instead of the explicit formatting characters”. So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in “streamed” plain text. I don’t think this is the way to go – particular issues should be fixed by a high level interface taking into account the needs of the document. And here is where luatex excels, because everything related to bidi writing is under our control.

```

7777 <*basic-r
7778 Babel.bidi_enabled = true
7779
7780 require('babel-data-bidi.lua')
7781
7782 local characters = Babel.characters
7783 local ranges = Babel.ranges
7784
7785 local DIR = node.id("dir")
7786
7787 local function dir_mark(head, from, to, outer)
7788   dir = (outer == 'r') and 'TLT' or 'TRT' -- i.e., reverse
7789   local d = node.new(DIR)
7790   d.dir = '+' .. dir
7791   node.insert_before(head, from, d)
7792   d = node.new(DIR)
7793   d.dir = '-' .. dir
7794   node.insert_after(head, to, d)
7795 end
7796
7797 function Babel.bidi(head, ispar)
7798   local first_n, last_n          -- first and last char with nums
7799   local last_es                  -- an auxiliary 'last' used with nums
7800   local first_d, last_d          -- first and last char in L/R block
7801   local dir, dir_real

```

Next also depends on script/lang (<al>/<r>). To be set by babel. tex.pardir is dangerous, could be (re)set but it should be changed only in vmode. There are two strong’s – strong = l/al/r and strong\_lr = l/r (there must be a better way):

```

7802   local strong = ('TRT' == tex.pardir) and 'r' or 'l'
7803   local strong_lr = (strong == 'l') and 'l' or 'r'
7804   local outer = strong
7805
7806   local new_dir = false
7807   local first_dir = false
7808   local inmath = false
7809
7810   local last_lr
7811
7812   local type_n = ''
7813
7814   for item in node.traverse(head) do
7815
7816     -- three cases: glyph, dir, otherwise
7817     if item.id == node.id'glyph'
7818       or (item.id == 7 and item.subtype == 2) then
7819
7820       local itemchar
7821       if item.id == 7 and item.subtype == 2 then
7822         itemchar = item.replace.char
7823       else
7824         itemchar = item.char
7825       end
7826       local chardata = characters[itemchar]
7827       dir = chardata and chardata.d or nil
7828       if not dir then

```

```

7829     for nn, et in ipairs(ranges) do
7830         if itemchar < et[1] then
7831             break
7832         elseif itemchar <= et[2] then
7833             dir = et[3]
7834             break
7835         end
7836     end
7837 end
7838 dir = dir or 'l'
7839 if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end

```

Next is based on the assumption babel sets the language *and* switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a 'dir' node. We don't know the current language until then. This is not exactly true, as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

7840     if new_dir then
7841         attr_dir = 0
7842         for at in node.traverse(item.attr) do
7843             if at.number == Babel.attr_dir then
7844                 attr_dir = at.value & 0x3
7845             end
7846         end
7847         if attr_dir == 1 then
7848             strong = 'r'
7849         elseif attr_dir == 2 then
7850             strong = 'al'
7851         else
7852             strong = 'l'
7853         end
7854         strong_lr = (strong == 'l') and 'l' or 'r'
7855         outer = strong_lr
7856         new_dir = false
7857     end
7858
7859     if dir == 'nsm' then dir = strong end -- W1

```

**Numbers.** The dual <al>/<r> system for R is somewhat cumbersome.

```

7860     dir_real = dir -- We need dir_real to set strong below
7861     if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

7862     if strong == 'al' then
7863         if dir == 'en' then dir = 'an' end -- W2
7864         if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
7865         strong_lr = 'r' -- W3
7866     end

```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```

7867     elseif item.id == node.id'dir' and not inmath then
7868         new_dir = true
7869         dir = nil
7870     elseif item.id == node.id'math' then
7871         inmath = (item.subtype == 0)
7872     else
7873         dir = nil -- Not a char
7874     end

```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, i.e., a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I

would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```

7875   if dir == 'en' or dir == 'an' or dir == 'et' then
7876       if dir ~= 'et' then
7877           type_n = dir
7878       end
7879       first_n = first_n or item
7880       last_n = last_es or item
7881       last_es = nil
7882   elseif dir == 'es' and last_n then -- W3+W6
7883       last_es = item
7884   elseif dir == 'cs' then           -- it's right - do nothing
7885   elseif first_n then -- & if dir = any but en, et, an, es, cs, inc nil
7886       if strong_lr == 'r' and type_n ~= '' then
7887           dir_mark(head, first_n, last_n, 'r')
7888       elseif strong_lr == 'l' and first_d and type_n == 'an' then
7889           dir_mark(head, first_n, last_n, 'r')
7890           dir_mark(head, first_d, last_d, outer)
7891           first_d, last_d = nil, nil
7892       elseif strong_lr == 'l' and type_n ~= '' then
7893           last_d = last_n
7894       end
7895       type_n = ''
7896       first_n, last_n = nil, nil
7897   end

```

R text in L, or L text in R. Order of dir\_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir\_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```

7898   if dir == 'l' or dir == 'r' then
7899       if dir ~= outer then
7900           first_d = first_d or item
7901           last_d = item
7902       elseif first_d and dir ~= strong_lr then
7903           dir_mark(head, first_d, last_d, outer)
7904           first_d, last_d = nil, nil
7905       end
7906   end

```

**Mirroring.** Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resptly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last\_lr is nil) of an R text, they are mirrored directly. Numbers in R mode are processed. It should not be done, but it doesn't hurt.

```

7907   if dir and not last_lr and dir ~= 'l' and outer == 'r' then
7908       item.char = characters[item.char] and
7909           characters[item.char].m or item.char
7910   elseif (dir or new_dir) and last_lr ~= item then
7911       local mir = outer .. strong_lr .. (dir or outer)
7912       if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
7913           for ch in node.traverse(node.next(last_lr)) do
7914               if ch == item then break end
7915               if ch.id == node.id'glyph' and characters[ch.char] then
7916                   ch.char = characters[ch.char].m or ch.char
7917               end
7918           end
7919       end
7920   end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir\_real).

```

7921   if dir == 'l' or dir == 'r' then

```

```

7922     last_lr = item
7923     strong = dir_real          -- Don't search back - best save now
7924     strong_lr = (strong == 'l') and 'l' or 'r'
7925     elseif new_dir then
7926         last_lr = nil
7927     end
7928 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

7929 if last_lr and outer == 'r' then
7930     for ch in node.traverse_id(node.id('glyph', node.next(last_lr)) do
7931         if characters[ch.char] then
7932             ch.char = characters[ch.char].m or ch.char
7933         end
7934     end
7935 end
7936 if first_n then
7937     dir_mark(head, first_n, last_n, outer)
7938 end
7939 if first_d then
7940     dir_mark(head, first_d, last_d, outer)
7941 end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

7942 return node.prev(head) or head
7943 end
7944 </basic-r

```

And here the Lua code for bidi=basic:

```

7945 (*basic
7946 -- e.g., Babel.fontmap[1][<prefontid>]=<dirfontid>
7947
7948 Babel.fontmap = Babel.fontmap or {}
7949 Babel.fontmap[0] = {}          -- l
7950 Babel.fontmap[1] = {}          -- r
7951 Babel.fontmap[2] = {}          -- al/an
7952

## 11. Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```
% [0x0021]={c='ex'},
% [0x0024]={c='pr'},
% [0x0025]={c='po'},
% [0x0028]={c='op'},
% [0x0029]={c='cp'},
% [0x002B]={c='pr'},
%
```

For the meaning of these codes, see the Unicode standard.

## 12. The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation. For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```
8416 (*nil)
8417 \ProvidesLanguage{nil}[<@date@> v<@version@> Nil language]
8418 \LdfInit{nil}{datenil}
```

When this file is read as an option, i.e., by the `\usepackage` command, nil could be an ‘unknown’ language in which case we have to make it known.

```
8419 \ifx\l@nil\undefined
8420 \newlanguage\l@nil
8421 \@namedef{bbl@hyphendata@the\l@nil}{}}}% Remove warning
8422 \let\bbl@elt\relax
8423 \edef\bbl@languages{% Add it to the list of languages
8424 \bbl@languages\bbl@elt{nil}{the\l@nil}{}}
8425 \fi
```

This macro is used to store the values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`.

```
8426 \providehyphenmins{\CurrentOption}{\m@ne\m@ne}
```

The next step consists of defining commands to switch to (and from) the ‘nil’ language.

**`\captionnil`**

**`\datenil`**

```
8427 \let\captionnil\@empty
8428 \let\datenil\@empty
```

There is no locale file for this pseudo-language, so the corresponding fields are defined here.

```
8429 \def\bbl@inidata@nil{%
8430 \bbl@elt{identification}{tag.ini}{und}%
8431 \bbl@elt{identification}{load.level}{0}%
8432 \bbl@elt{identification}{charset}{utf8}%
8433 \bbl@elt{identification}{version}{1.0}%
8434 \bbl@elt{identification}{date}{2022-05-16}%
8435 \bbl@elt{identification}{name.local}{nil}%
8436 \bbl@elt{identification}{name.english}{nil}%

8438 \bbl@elt{identification}{tag.bcp47}{und}%
8439 \bbl@elt{identification}{language.tag.bcp47}{und}%
8440 \bbl@elt{identification}{tag.opentype}{dflt}%
8441 \bbl@elt{identification}{script.name}{Latin}%
8442 \bbl@elt{identification}{script.tag.bcp47}{Latn}%
8443 \bbl@elt{identification}{script.tag.opentype}{DFLT}%
8444 \bbl@elt{identification}{level}{1}%
```

```

8445 \bbl@elt{identification}{encodings}{}%
8446 \bbl@elt{identification}{derivate}{no}}
8447 \@namedef{bbl@tbc@nil}{und}
8448 \@namedef{bbl@lbc@nil}{und}
8449 \@namedef{bbl@casing@nil}{und}
8450 \@namedef{bbl@lotf@nil}{dflt}
8451 \@namedef{bbl@elname@nil}{nil}
8452 \@namedef{bbl@lname@nil}{nil}
8453 \@namedef{bbl@esname@nil}{Latin}
8454 \@namedef{bbl@sname@nil}{Latin}
8455 \@namedef{bbl@sbc@nil}{Latn}
8456 \@namedef{bbl@sotf@nil}{latn}

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

8457 \ldf@finish{nil}
8458 </nil>

```

## 13. Calendars

The code for specific calendars are placed in the specific files, loaded when requested by an ini file in the identification section with `require.calendars`.

Start with function to compute the Julian day. It's based on the little library `calendar.js`, by John Walker, in the public domain.

```

8459 <<*Compute Julian day>> ≡
8460 \def\bbl@fpmo#1#2{(#1-#2*floor(#1/#2))}
8461 \def\bbl@cs@gregleap#1{%
8462   (\bbl@fpmo{#1}{4} == 0) &&
8463   (!((\bbl@fpmo{#1}{100} == 0) && (\bbl@fpmo{#1}{400} != 0)))}
8464 \def\bbl@cs@jd#1#2#3{% year, month, day
8465   \fp_eval:n{ 1721424.5 + (365 * (#1 - 1)) +
8466     floor((#1 - 1) / 4) + (-floor((#1 - 1) / 100)) +
8467     floor((#1 - 1) / 400) + floor(((367 * #2) - 362) / 12) +
8468     ((#2 <= 2) ? 0 : (\bbl@cs@gregleap{#1} ? -1 : -2)) + #3 } }
8469 <</Compute Julian day>>

```

### 13.1. Islamic

The code for the Civil calendar is based on it, too.

```

8470 <*ca-islamic>
8471 \ExplSyntaxOn
8472 <@Compute Julian day>
8473 % == islamic (default)
8474 % Not yet implemented
8475 \def\bbl@ca@islamic#1-#2-#3\@#4#5#6{

```

The Civil calendar.

```

### 13.3. Persian

There is an algorithm written in TeX by Jabri, Abolhassani, Pournader and Esfahbod, created for the first versions of the FarsiTeX system (no longer available), but the original license is GPL, so its use with LPPL is problematic. The code here follows loosely that by John Walker, which is free and accurate, but sadly very complex, so the relevant data for the years 2013-2050 have been pre-calculated and stored. Actually, all we need is the first day (either March 20 or March 21).

```

## 14. Support for Plain T<sub>E</sub>X (plain.def)

### 14.1. Not renaming hyphen.tex

As Don Knuth has declared that the filename `hyphen.tex` may only be used to designate *his* version of the american English hyphenation patterns, a new solution has to be found in order to be able to load hyphenation patterns for other languages in a plain-based T<sub>E</sub>X-format. When asked he responded:

That file name is “sacred”, and if anybody changes it they will cause severe upward/downward compatibility headaches.

People can have a file `localhyphen.tex` or whatever they like, but they mustn’t diddle with `hyphen.tex` (or `plain.tex` except to preload additional fonts).

The files `bplain.tex` and `blplain.tex` can be used as replacement wrappers around `plain.tex` and `lplain.tex` to achieve the desired effect, based on the `babel` package. If you load each of them with `iniTEX`, you will get a file called either `bplain.fmt` or `blplain.fmt`, which you can use as replacements for `plain.fmt` and `lplain.fmt`.

As these files are going to be read as the first thing `iniTEX` sees, we need to set some category codes just to be able to change the definition of `\input`.

```

8941 <{*bplain | blplain>
8942 \catcode`\{=1 % left brace is begin-group character
8943 \catcode`\}=2 % right brace is end-group character
8944 \catcode`\#=6 % hash mark is macro parameter character

```

If a file called `hyphen.cfg` can be found, we make sure that *it* will be read instead of the file `hyphen.tex`. We do this by first saving the original meaning of `\input` (and I use a one letter control sequence for that so as not to waste multi-letter control sequence on this in the format).

```
8945 \openin 0 hyphen.cfg
8946 \ifeof0
8947 \else
8948 \let\input
```

Then `\input` is defined to forget about its argument and load `hyphen.cfg` instead. Once that's done the original meaning of `\input` can be restored and the definition of `\a` can be forgotten.

```
8949 \def\input #1 {%
8950 \let\input\input
8951 \a hyphen.cfg
8952 \let\input\input
8953 }
8954 \fi
8955 \bblatex\blatex
```

Now that we have made sure that `hyphen.cfg` will be loaded at the right moment it is time to load `plain.tex`.

```
8956 \bblatex\input\plain.tex
8957 \bblatex\input\lplain.tex
```

Finally we change the contents of `\fmtname` to indicate that this is *not* the plain format, but a format based on plain with the `babel` package preloaded.

```
8958 \bblatex\def\fmtname{babel-plain}
8959 \bblatex\def\fmtname{babel-lplain}
```

When you are using a different format, based on `plain.tex` you can make a copy of `blplain.tex`, rename it and replace `plain.tex` with the name of your format file.

## 14.2. Emulating some $\text{\LaTeX}$ features

The file `babel.def` expects some definitions made in the  $\text{\LaTeX} 2_{\epsilon}$  style file. So, in Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only `\babeloptionstrings` and `\babeloptionmath` are provided, which can be defined before loading `babel`. `\BabelModifiers` can be set too (but not sure it works).

```
8960 \def\EmulateLaTeX{}
8961 \def\@empty{}
8962 \def\loadlocalcfg#1{%
8963 \openin0#1.cfg
8964 \ifeof0

9131 \bbl@tempa

```

$\TeX$  has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (`activegrave` and `activeacute`). For plain  $\TeX$  we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

9132 \def\@ifpackagewith#1#2#3#4{#3}

```

The  $\TeX$  macro `\@ifl@aded` checks whether a file was loaded. This functionality is not needed for plain  $\TeX$  but we need the macro to be defined as a no-op.

```

9133 \def\@ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their  $\TeX 2_{\epsilon}$  versions; just enough to make things work in plain  $\TeX$  environments.

```

9134 \ifx\@tempcnta\@undefined
9135     \csname newcount\endcsname\@tempcnta\relax
9136 \fi
9137 \ifx\@tempcntb\@undefined
9138     \csname newcount\endcsname\@tempcntb\relax
9139 \fi

```

To prevent wasting two counters in  $\TeX$  (because counters with the same name are allocated later by it) we reset the counter that holds the next free counter (`\count10`).

```

9332 </plain>

```

## 15. Acknowledgements

In the initial stages of the development of babel, Bernd Raichle provided many helpful suggestions and Michel Goossens supplied contributions for many languages. Ideas from Nico Poppelier, Piet van Oostrum and many others have been used. Paul Wackers and Werenfried Spit helped find and repair bugs.

More recently, there are significant contributions by Salim Bou, Ulrike Fischer, Loren Davis and Udi Fogiel.

Barbara Beeton has helped in improving the manual.

There are also many contributors for specific languages, which are mentioned in the respective files. Without them, babel just wouldn't exist.
